GX Configurator-SC Version 2

MITSUBISHI

Operating Manual

(Protocol FB support function))

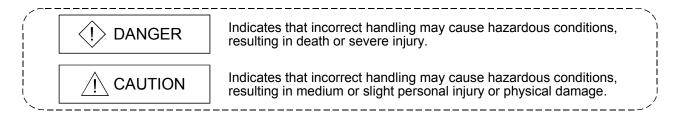

SAFETY PRECAUTIONS •

(Always read these instructions before using this equipment.)

Before using this product, please read this manual and the relevant manuals introduced in this manual carefully and pay full attention to safety to handle the product correctly.

The instructions given in this manual are concerned with this product. For the safety instructions of the programmable controller system, please read the CPU module user's manual. In this manual, the safety instructions are ranked as "DANGER" and "CAUTION".

Note that the \triangle CAUTION level may lead to a serious consequence according to the circumstances. Always follow the instructions of both levels because they are important to personal safety.

Please save this manual to make it accessible when required and always forward it to the end user.

[Startup/Maintenance Precautions]

↑ CAUTION

• Before starting online operations such as a communication test, consider the operation of the connected device and fully ensure safety.

About Manuals

The following lists the manuals relevant to this software package. These manuals are separately available if necessary.

Related Manuals

Manual Name	Manual Number (Model Code)
Q Corresponding Serial Communication Module User's Manual (Basics) Explains the outline, applicable system configuration, specifications, pre-operation procedure, basic data communication method with the other device, maintenance, inspection, and troubleshooting for use of the module. (Sold separately)	SH-080006 (13JL86)
Q Corresponding Serial Communication Module User's Manual (Application) Explains the specifications and usage of the module's special functions, the settings for use of the special functions, and the method of data communication with the other device. (Sold separately)	SH-080007 (13JL87)
Q Corresponding MELSEC Communication Protocol Reference Manual Explains how the other device performs read, write, etc. of PLC CPU data by making communication in the MC protocol using the serial communication module/Ethernet module. (Sold separately)	SH-080008 (13JF89)
GX Developer Version 8 Operating Manual (Startup) Explains the system configuration, installation method, and startup method of GX Developer. (Sold separately)	SH-080372E (13JU40)
GX Developer Version 8 Operating Manual Explains the program creation method, printout method, monitor method, debugging method, etc. using GX Developer. (Sold separately)	SH-080373E (13JU41)
GX Developer Version 8 Operating Manual (Function Block) Explains the function block creation method, printout method, etc. using GX Developer. (Sold separately)	SH-080376E (13JU46)

REMARK

The manuals are available separately in printed form as options. Please place an order with the manual number (model code) in the above table.

A-6

How to Use This Manual

The symbols used in this manual and their definitions and examples will be explained.

Symbol	Description	Example
[]	Menu name of the menu bar	[Project]
<< >>	Tab name of the dialog box	< <main>></main>
" "	Item name of the dialog box	"Name"
	Command button of the dialog box	Setting Button

PURPOSE

Purpose of the operation that is explained in the corresponding chapter, section or item.

BASIC OPERATION

Operation performed until the screen for actually achieving the purpose is displayed.

DISPLAY/SETTING SCREEN

Screen used to make setting and/or provide a display for the purpose.

DISPLAY/SETTING DETAILS

Explains the display/setting screen items.

Explains the especially noted items of the explanation, functions desired to be known, etc..

REMARK

Gives information useful as the knowledge related to the explanation.

A - 7 A - 7

Generic Terms and Abbreviations Used in This Manual

In this manual, the following generic terms and abbreviations are used to represent the GX Configurator-SC software package and PLC CPU modules. The module/package name is given when the target model name must be pointed out explicitly.

Generic Term/Abbreviation	Generic Term/Abbreviation
GX Configurator-SC	Generic product name of the model names SWnD5C-QSCU-E and SWnD5C-QSCU-EA. (n means Version 2 or later.)
Protocol FB support function	Means the protocol FB support function of GX Configurator-SC.
Protocol FB	Abbreviation of the communication control function block.
Q Series C24 module	Generic term of the serial communication module and modem interface module.
Serial communication module	Generic term of the QJ71C24, QJ71C24-R2, QJ71C24N, QJ71C24N-R2 and QJ71C24N-R4.
QJ71C24N module	Generic term of the QJ71C24N, QJ71C24N-R2 and QJ71C24N-R4.
Device controller	Generic term of the external devices that communicate with the Q series C24 modules.
Intelligent function module utility	Utility in GX Configurator-SC.
Communication control program	Program for communication with the device controller.
Module initialization FB	FB that performs the initial setting of the module among the protocol FBs.
Send FB	FB that sends data to the device controller among the protocol FBs.
Receive FB	FB that receives data from the device controller among the protocol FBs.
I/O variable	Label used in an FB (FB variable).
Windows Vista [®]	Generic term for the following: Microsoft® Windows Vista® Home Basic Operating System, Microsoft® Windows Vista® Home Premium Operating System, Microsoft® Windows Vista® Business Operating System, Microsoft® Windows Vista® Ultimate Operating System, Microsoft® Windows Vista® Enterprise Operating System
Windows [®] XP	Generic term for the following: Microsoft® Windows® XP Professional Operating System, Microsoft® Windows® XP Home Edition Operating System
GX Developer	Generic product name of the product model names SWnD5C-GPPW-E, SWnD5C-GPPW-EA, SWnD5C-GPPW-EV and SWnD5C-GPPW-EVA. (n means Version 8 or later.)
FB	Abbreviation of the function block.
QCPU (Q mode)	Generic term of the Q00(J)CPU, Q01CPU, Q02(H)CPU, Q06HCPU, Q12HCPU, Q25HCPU, Q12PHCPU and Q25PHCPU.

A - 8

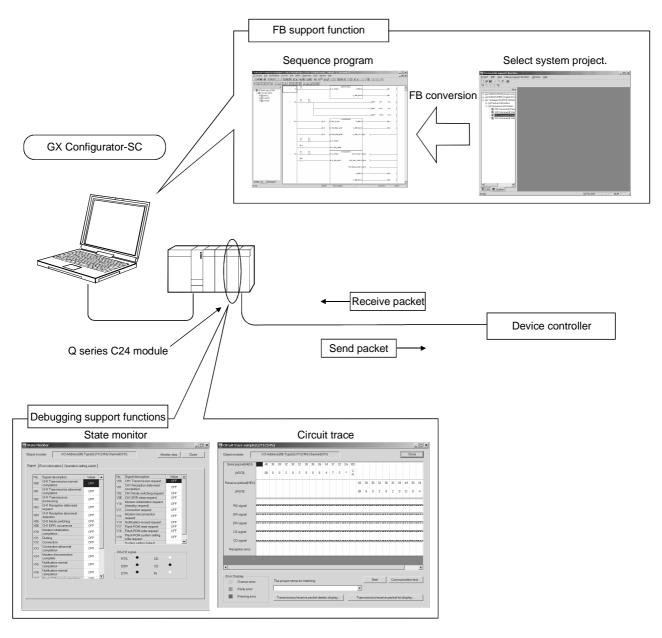

1 OVERVIEW

GX Configurator-SC Version 2 (hereafter abbreviated to GX Configurator-SC) is the software added into GX Developer for use.

Conventionally, to perform the communication processing of the serial communication module/modem interface module (hereafter abbreviated to the Q series C24 module) with a device controller, a wide variety of complicated sequence programs, e.g. device-specific message format creation and data communication, had to be created by the user in the nonprocedural protocol.

On this software, user-created communication control programs are available as function blocks (hereafter abbreviated to FBs). The user can create a communication control program easily by making use of these FBs.

Also, since the communication debugging functions necessary for system startup are provided, operations from communication control program creation to system startup-time debugging can be performed with this software only.

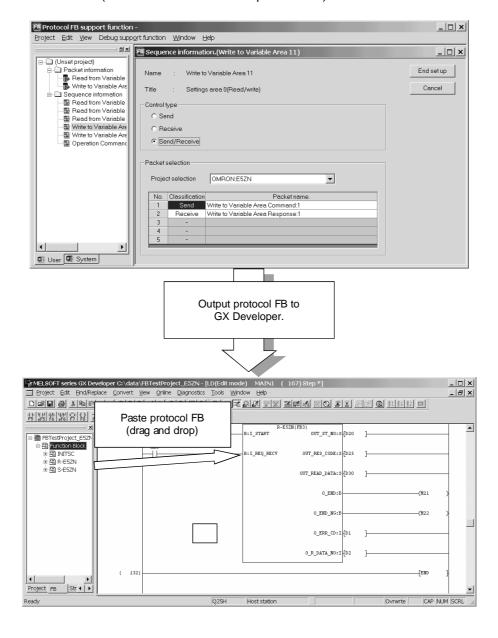

1.1 Features

 Automatic creation of communication control program (function blocks)

Reduced work for creating sequence for communication control!!

Since data for various device controllers are available, the user merely needs to perform FB conversion to create a communication control function block (hereafter abbreviated to a protocol FB).

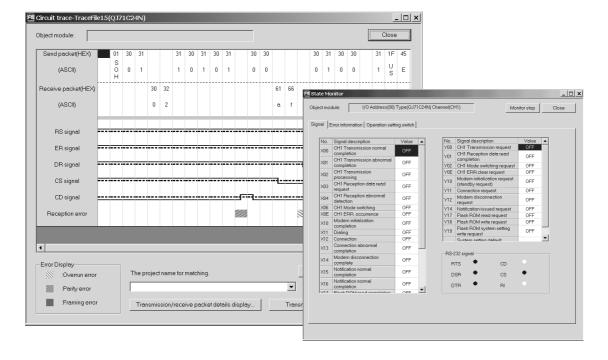

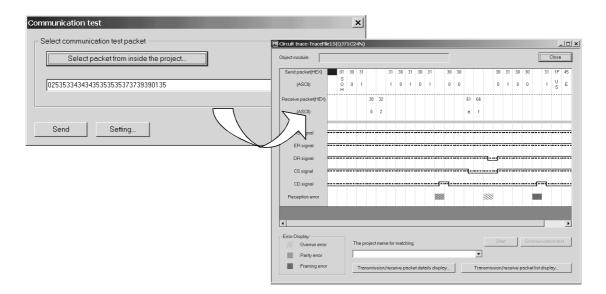

- (a) No requirement of packet construction specific to device controller The protocol FB support function has preset data for various data controllers. The user merely needs to select the device controller and its processing items to create a protocol FB automatically without being conscious of dedicated instruction.
- (b) Desired setting of data communication procedure When the user constructs any packet originally, setting can be made easily for each device controller.

(2) Communication debugging support

Reduced debugging work for system startup!!

The debugging functions required for system startup for communication of the Q series C24 module with the device controller are available. Packet data on the line can be confirmed without any other tool being used.

(a) Circuit trace

The transmission/receive packet data and communication signal wire condition between the Q series C24 module and device controller can be traced.

- Transmission/receive packet details display
 The transmission/receive packet data obtained by circuit trace are displayed in detail on the basis of the packet information.
- 2) Transmission/receive packet list display The transmission/receive packet data obtained by circuit trace are displayed separately in lists on a packet-by-packet basis.

(b) Communication test

Test transmission (any/set data) can be made from the Q series C24 module to the device controller.

By starting the circuit trace and the following state monitor simultaneously, the packet communication data on the line can be confirmed.

(c) State monitor

The error status, communication signal line condition, etc. of the Q series C24 module can be monitored.

(3) New functions of GX Configurator-SC

With upgrade from Version 2.03D (SW2D5C-QSCU) to Version 2.04E (SW2D5C-QSCU), following functions/setting items are newly added to GX Configurator-SC.

- (a) Create receive (specified length) packet The receive frame with fixed packet length, header and no end judgment data can be created.
- (b) Module start I/O No. setting

It is possible to set start I/O No. of the Q series C24 module to which FB programs are output.

2 OPERATING ENVIRONMENT

This chapter explains the operating environment of the personal computer that uses the protocol FB support function.

	Item	Peripheral device
Installation (add-in) target *1		Add-in to GX Developer Version 8 (English version) or later *2
Computer		Windows® -based personal computer
	CPU	Refer to the following table "Operating system and performance required for personal
	Required memory	computer".
Hard disk	For installation	65MB or more
space*3	For operation	20MB or more
Display		800 $ imes$ 600 dots or more resolution $^{^{*4}}$
Operating sy	vstem	Microsoft® Windows® 95 Operating System (English version) Microsoft® Windows® 98 Operating System (English version) Microsoft® Windows® Millennium Edition Operating System (English version) Microsoft® Windows NT® Workstation Operating System Version 4.0 (English version) Microsoft® Windows® 2000 Professional Operating System (English version) Microsoft® Windows® XP Professional Operating System (English version) Microsoft® Windows® XP Home Edition Operating System (English version) Microsoft® Windows Vista® Home Basic Operating System (English version) Microsoft® Windows Vista® Home Premium Operating System (English version) Microsoft® Windows Vista® Business Operating System (English version) Microsoft® Windows Vista® Ultimate Operating System (English version) Microsoft® Windows Vista® Enterprise Operating System (English version)

^{*1:} Install GX Configurator-SC in GX Developer Version 8 or higher in the same language.

GX Developer (English version) and GX Configurator-SC (Japanese version) cannot be used in combination, and GX Developer (Japanese version) and GX Configurator-SC (English version) cannot be used in combination.

- *2: The protocol FB support function cannot be used if it is added into GX Developer Version 7 or earlier.
- *3: At least 15GB is required for Windows Vista®.

Operating system and performance required for personal computer

Operating system	Performance required for personal computer	
Operating system	CPU	Required memory
Windows® 95 (Service Pack 1 or later)	Pentium® 133MHz or more	32MB or more
Windows® 98	Pentium® 133MHz or more	32MB or more
Windows® Me	Pentium® 150MHz or more	32MB or more
Windows NT® 4.0 Workstation (Service Pack 3 or later)	Pentium® 133MHz or more	32MB or more
Windows® 2000 Professional	Pentium® 133MHz or more	64MB or more
Windows® XP Professional	Pentium® 300MHz or more	128MB or more
Windows® XP Home Edition	Pentium® 300MHz or more	128MB or more
Windows Vista® Home Basic	Pentium® 1GHz or more	1GB or more
Windows Vista® Home Premium	Pentium® 1GHz or more	1GB or more
Windows Vista® Business	Pentium® 1GHz or more	1GB or more
Windows Vista® Ultimate	Pentium® 1GHz or more	1GB or more
Windows Vista® Enterprise	Pentium® 1GHz or more	1GB or more

^{*4:} Resolution of 1024 × 768 dots or more is recommended for Windows Vista® .

The functions shown below are not available for Windows $^{\rm @}$ XP and Windows Vista $^{\rm @}$.

If any of the following functions is attempted, this product may not operate normally.

Start of application in Windows® compatible mode

Fast user switching

Remote desktop

Large fonts (Details setting of Display Properties)

Also, 64-bit version Windows® XP and Windows Vista® are not supported.

3 FUNCTION LIST

This chapter explains the functions and menu of the protocol FB support function.

3.1 Function List

The functions of the protocol FB support function are listed below.

(1) Protocol FB support function

Function	Function outline	Reference Section
Module setting	Make the initial setting of the module used with the protocol FB support function. Used at the time of protocol FB conversion.	7.1
Packet construction information setting	Set the packet construction elements (message format) of the device controller.	7.2.3
Packet data information setting	Set detailed data to the construction elements of the packet construction information to set the data for actual communication.	7.2.4
Sequence information setting	Set the communication processing control type (send, receive, communication) and the packet data that matches that type to set the information for creation of a protocol FB.	7.3
FB conversion of sequence information	Convert the specified sequence information into a protocol FB. The created protocol FB is inserted into the < <fb>> tab of GX Developer.</fb>	7.4

(2) Debugging support functions

Function	Function outline	Reference Section
Circuit trace	Traces the transmission/receive packet data and communication signal wire condition. • Transmission/receive packet details display The packet information is collated with the transmission/receive data obtained by circuit trace and the details of each packet are displayed. • Transmission/receive packet list display The obtained transmission/receive packet data are displayed separately in lists on a packet-by-packet basis.	9.2
	Save/read of trace data Saves/reads the data obtained by circuit trace.	9.2.5
Communication test	Performs a communication test on any packet data from the Q series C24 module to the device controller.	9.3
State monitor	Monitors the error status, communication signal wire, etc. of the Q series C24 module.	9.4

The following table shows the modules to which the protocol FB support functions can be applied and their function ranges.

Applicable modules and function ranges

Applicable module		Protocol FB	Debugging Support Function		
	pplicable module	support function	Circuit trace	Communication test	State monitor
Q series C24 modules	QJ71C24, QJ71C24-R2	0	×	×	0
	QJ71C24N, QJ71C24N-R2, QJ71C24N-R4	0	0	0	0

4 SCREEN DISPLAY

This chapter explains the screen display and names of the protocol FB support function.

4.1 Screen Display

The protocol FB support function consists of the project tree area, which shows a data configuration, and the function screen area.

The basic screen display of the protocol FB support function is shown below.

The following table indicates the names and functions.

Name	Function
Main menu	Select the menu item.
Toolbar	Click the selected button to execute the function.
Project tree	Manage various data of the system/user project.
Function Screen	Module setting, packet construction information setting, packet data information setting, sequence information setting screens, etc. are available.
Status bar	Displays various statuses. Move the cursor over any of the buttons to display its guidance.

4

4.2 Toolbar

The toolbar consists of the tool buttons and guide tool buttons.

When the cursor is moved over any of the buttons, the tool tip is displayed, and at the same time, its guidance is displayed on the status bar.

The toolbar can be displayed or hidden by choosing [View] \rightarrow [Toolbar].

The following table lists the tool buttons.

Tool Button	Tool Tip	Guidance
	New project	Create a new project.
=	Open project	Open the existing project.
	Save	Save the project over the old one.
*	Cut	Cut the selected data.
	Сору	Copy the selected data.
	Paste	Past the selected data.
	Print	Print the project data.

The guide tool buttons display the protocol FB creating procedure in Step 1 to Step 5. A protocol FB can be created by making setting in order of Step 1 to Step 5. The following table lists the guide tool buttons.

Guide Tool Button	Tool Tip	Guidance
Step	Open Module Setting	Open the module setting screen.
Step	New Packet information	Create new packet information.
Steg	Open packet data information	Open the packet data information.
Step	New sequence information	Create new sequence information.
Steg	FB conversion of sequence information	Convert the sequence information to generate the user FB.

4.3 Status Bar

The status bar displays status data.

The status bar can be displayed or hidden by choosing [View] \rightarrow [Status bar].

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

No.	Display/Setting Details
1)	Displays the guidance and packet data information item setting information.
2)	Displays the model name of the Q series C24 module.
3)	Displays the Caps Lock status.
4)	Displays the Num Lock status.
5)	Displays the Scroll Lock status.

4.4 Project Tree

The project tree consists of a system project tree and user project tree.

Display screen switching is executed by clicking the tab.

The system project indicates the packet construction information, packet data information and sequence information for various device controllers entried at installation of GX Configurator-SC.

4.4.1 System project tree

PURPOSE

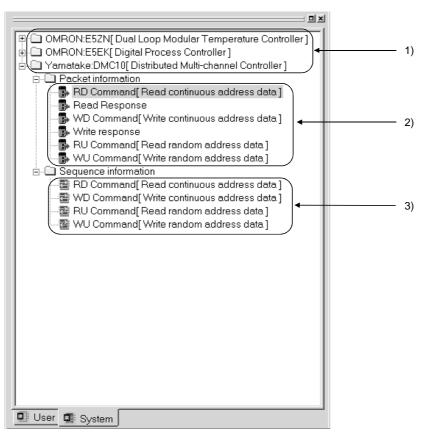

The system project tree displays the packet construction information, packet data information and sequence information of various device controllers already entered.

BASIC OPERATION

- 1. Click the <<System>> tab in the project tree.
- 2. The system project tree is displayed.

DISPLAY/SETTING DETAILS

No.	Item	Display/Setting Details
1)	Device controller name	The entered device controller names are displayed.
2)	System packet information name	The system packet information names are displayed.
3)	System sequence information name	The system sequence information names are displayed.

4.4.2 User project tree

PURPOSE

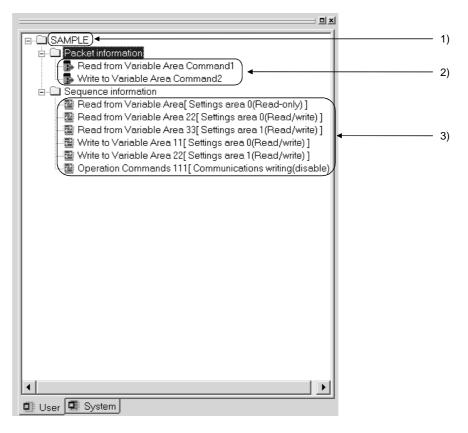

The user project tree displays the packet information and sequence information of the project created by the user.

BASIC OPERATION

- 1. Click the <<User>> tab in the project tree.
- 2. The user project tree is displayed.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

No.	Item	Display/Setting Details	
1)	User project name	The project names set by the user are displayed.	
0)	User packet information	The user packet information names created by the user are	
2)	name	displayed.	
۵)	User sequence information	oroject name The project names set by the user are displayed.	
3)	name	are displayed.	

4 - 6 4 - 6

5 START AND END OF PROTOCOL FB SUPPORT FUNCTION AND PROJECT CREATION

This chapter explains the methods for starting and ending the protocol FB support function and the functions required to create a project.

REMARK

Unless otherwise specified, a "project" indicates the "project of the protocol FB support function".

5.1 Starting the Protocol FB Support Function

PURPOSE

Start the protocol FB support function from GX Developer.

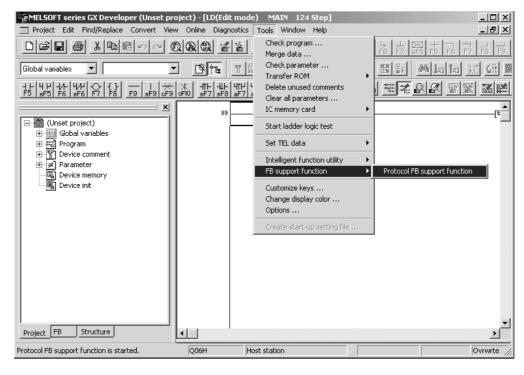

BASIC OPERATION

- 1. Click the [Tools] \rightarrow [FB support function] \rightarrow [Protocol FB support function] menu.
- 2. The protocol FB support function starts.

DISPLAY/SETTING SCREEN

5 - 1 5 - 1

- When creating a new project using GX Developer, select "Use label". If "Do not use label" is selected, only the debugging support functions can be used.
- The protocol FB support function can be used when the project file of GX Developer Version 8 or later is used with the QCPU (Q mode).

5

5.2 Exiting the Protocol FB Support Function

PURPOSE

End the protocol FB support function.

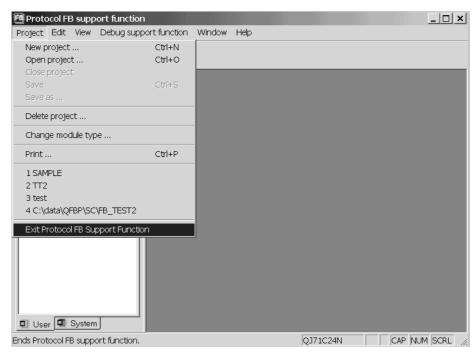

BASIC OPERATION

Click the [Project] \rightarrow [Exit Protocol FB Support Function] menu.

DISPLAY/SETTING SCREEN

5.3 Creating a Project

The following indicates a project function list.

Function	Function outline
New project	Creates a new project.
Open project	Opens the existing project.
Close project	Closes the currently open project.
Save project	"Saves" or "Saves as" the currently edited project.
Delete project	Deletes the project.
Change module type	Changes the object module of the currently open project.

Module information, packet information and sequence information are saved into the project.

5.3.1 Creating a new project

PURPOSE

Create a new project of the protocol FB support function. The created project is inserted into the user project tree.

BASIC OPERATION

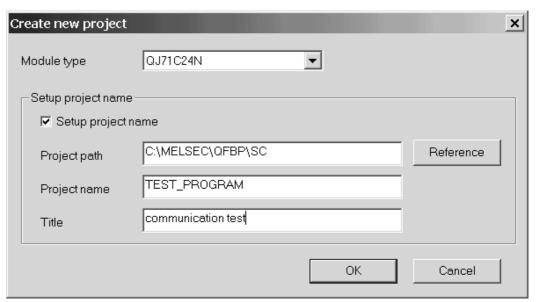

- 1. Click the [Project] \rightarrow [New project] menu (\square).
- 2. Select the "Module type" on the New project screen.
- 3. Set the "Project path".
- 4. Set the "Project name".
- 5. Set the "Title".
- 6. Click the OK button.
- 7. A new project is created.

REMARK

"Project file name specification" can be done either before or after program creation.

5 - 4 5 - 4

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/Setting Details
Module type	Select the module type to be used in the project.
"Project name setting" check button	Checking the check button enables input to the following items.
Reference button	Displays the project reference screen.
Project path	Set the path of the new project. The usable number of characters is within 150 characters including those of the project name.
Project name	Set the name of the new project. The usable number of characters is within 32 characters. (Note that the project name cannot be set if the number of characters including that of the project path exceeds 150.)
Title	Set the title of the new project.

REMARK

Refer to Appendix 2 for the restrictions on the names (such as the project name) to be set.

5.3.2 Opening the project

PURPOSE

Read the existing project.

BASIC OPERATION

- 1. Click the [Project] \rightarrow [Open project] menu (\square).
- 2. Click the project name.
- 3. Click the Open button.

5.3.3 Closing the project

PURPOSE

Close the open project file.

BASIC OPERATION

- 1. Click the [Project] \rightarrow [Close project] menu.
- 2. If the setting has been changed, the project save confirmation screen is displayed.
 - · Click the Yes button to save and close the project.
 - · Click the No button to close the project without saving it.

5.3.4 Saving the project

PURPOSE

Save the currently edited project file.

BASIC OPERATION

- (1) Saving the project over the old one
 - 1. Click the [Project] \rightarrow [Save] menu (\blacksquare).
 - 2. The currently edited project file is saved over the old one.
- (2) Saving the project with a name
 - 1. Click the [Project] → [Save as] menu.
 - 2. Set the "Project path" and "Project name".
 - 3. Click the Save button.
 - 4. The currently edited project file is saved with a name.

5 - 6 5 - 6

5.3.5 Deleting the project of the protocol FB support function

PURPOSE

Delete the project file.

BASIC OPERATION

- 1. Click the [Project] → [Delete project] menu.
- 2. Specify the "Drive/Path" and "Project name" to be deleted.
- 3. Click the Delete button.
- 4. As the project deletion confirmation screen is displayed, click the Yes button.
- 5. The project is deleted.

5.3.6 Changing the module type

PURPOSE

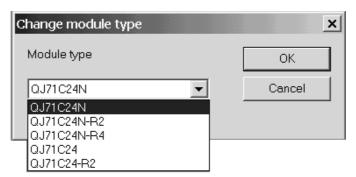

Change the type of the preset Q series C24 module.

BASIC OPERATION

- 1. Click the [Project] → [Change module type] menu.
- 2. Select a new module type.
- 3. After the setting is completed, click the OK button. The module type is changed.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item		Display/Setting Details	
	Select a new module t	ype.	
	Any of the following me	odules can be selected.	
Module type	- QJ71C24N	· QJ71C24	
	- QJ71C24N-R2	· QJ71C24-R2	
	- QJ71C24N-R4		

5 - 7 5 - 7

When the module type is changed, the following data return to the default values.

Transmission speed of module information

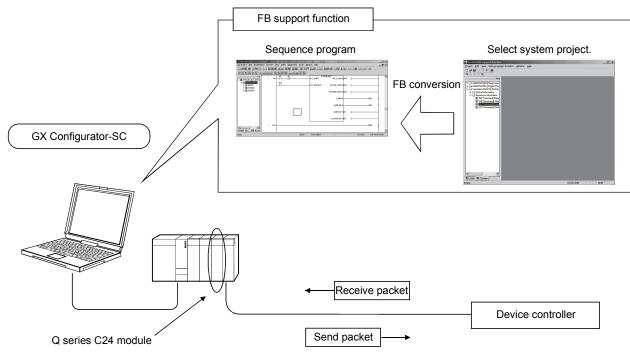

6 PROTOCOL FB CREATION OPERATING PROCEDURE

6.1 Protocol FB Construction Data

The protocol FB support function creates protocol FBs for communication with the device controller. Make the following settings to create protocol FBs.

- (1) Module setting
- (2) Creation of send/receive FBs (This operation is not required when the system project is used.)

The following shows the purpose and entry procedure of each data.

(1) Module setting

Module setting			
Kind	Item	CH1	T
	Data bit	7bit	ľ
	Parity bit	Yes	Ì
	Odd/even parity	Odd	İ
Mode switching	Stop bit	1bit	İ
	Sum check code	No	1
	Transmission speed	300bps	
	DTR/DSR control	DTR/DSR	
	DC1/DC3 control	No control	1
	DC1 code	11h	1
Transmission control	DC3 code	13h	1
Control	DC2/DC4 control	No control	1
	DC2 code	12h	
	DC4 code	14h	
Communication	CD terminal check	Check	
control	Communication system	Full duplex	
Half duplex communication control	Simultaneous transmission priority/non-priority	0 (x100ms)	
	Retransmission time transmission method	Do not resend.	

Set the parameters necessary for the initial setting of the Q series C24 module. The settings are reflected on the "Send/receive data" and "Module initialization FB".

For details, refer to "7.1 Module Setting".

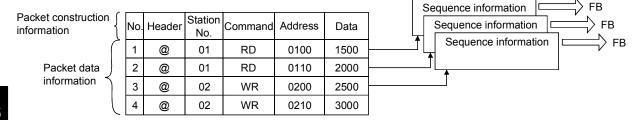

(2) Creation of send/receive FBs

To create send/receive FBs, it is required to set the packet construction information, packet data information and sequence information.

- (a) Packet construction information Entry the structure (header, fixed data, terminator, etc.) of the device controller to be communicated with.
- (b) Packet data information

 Entry the data to be transmitted (actual message) into the packet construction information entered in (a).
- (c) Sequence information Entry the data to be transmitted. By performing the FB conversion of this sequence information, a protocol FB for communication of the entry data is created.

The following shows the set data that comprise send and receive FBs.

6

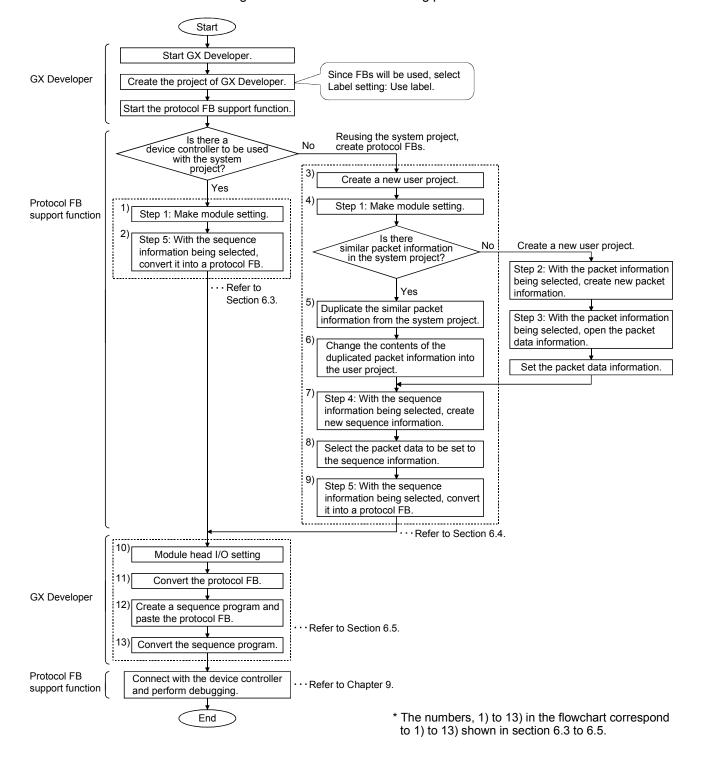

6.2 Communication Control Program Creating Procedure

This section explains the procedure for creating a communication control program using the protocol FB support function.

When the target device controller is in the system project, use the system project. Protocol FBs can be created easily.

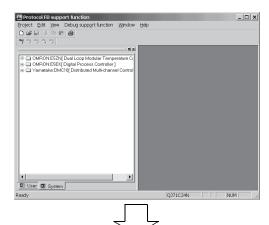

When the target device controller is not in the system project, protocol FBs can be created by modifying the system project or creating a new project.

The following flowchart indicates the creating procedure.

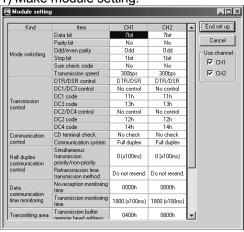

6.3 Operating Procedure for Use of System Project

The operating procedure for use of the system project will be explained using the actual screen as an example.

Starting the protocol FB support function selects the <<System project>> tab.

Operation:

Click or choose [Edit] \rightarrow [Module setting].

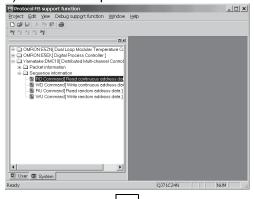

Make the initial setting of the Q series C24 module, and click the End set up button.

REMARK

Executing [FB conversion of sequence information] reflects the settings of the channel, which has been specified as "Channel" on the FB conversion check screen, in "Module initialization FB (INITSC)".

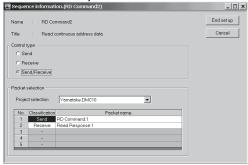

Select the sequence information from the system project.

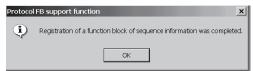

Operation:

Select the device controller to be communicated with from among the sequence information in the system project tree.

Convert into a protocol FB.

Operation:

Click $ightharpoonup \$ or choose [Edit] $ightharpoonup \$ [Sequence information] $ightharpoonup \$ [FB conversion of sequence information].

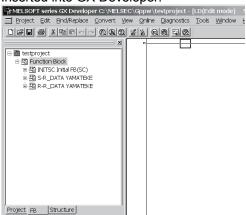

Input the FB program name, etc. and click the OK button.

REMARK

This will create an FB program for the channel specified in "Channel".

The protocol FB and module initialization FB are inserted into the <<FB>> tab of GX Developer.

Inserted into GX Developer.

Precautions for creating multiple module initialization FBs

At the time of [FB conversion of sequence information], a module initialization FB is created under the FB program name of "INITSC". If the module initialization FB (INITSC) exists in a GX Developer's project, the new FB is overwritten to the existing one.

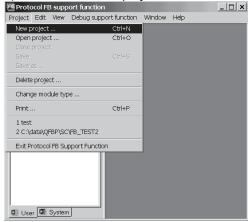

Therefore, when multiple module initialization FBs are needed for respective applications or channels, change the FB program name on GX Developer after [FB conversion of sequence information].

6.4 Operating Procedure for Use of User Project

When the system project does not have the target device controller, create a user program by reusing the system project or by creating all information such as packet information and sequence information.

This section explains the method of reusing the system project using the actual screen as an example.

3) Crete a new user project.

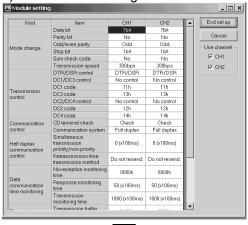

Operation:

Choose [Project] → [New project].

A new user project is created.

4) Make module setting.

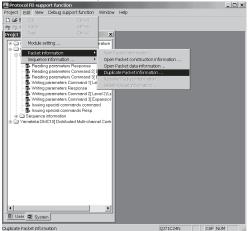

Operation:

Click or choose [Edit] \rightarrow [Module setting].

Make the initial setting of the Q series C24 module, and click the End set up button.

REMARK

Executing [FB conversion of sequence information] reflects the settings of the channel, which has been specified as "Channel" on the FB conversion check screen, in "Module initialization FB (INITSC)".

5) Duplicate the packet information from the system project.

Operation:

Choose [Edit] \rightarrow [Packet information] \rightarrow [Duplicate Packet information].

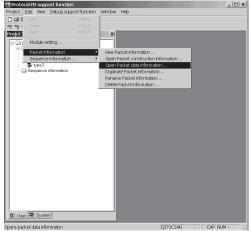

From the system project, select the packet information similar to the protocol of the target device controller and duplicate it in the user project.

Set the packet information name of the duplication destination.

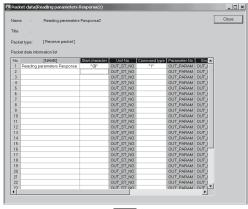

6) Change the duplicated packet information into the user project.

Operation:

Choose [Edit] \rightarrow [Packet information] \rightarrow [Open packet data information].

The packet data information opens.

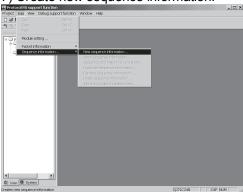

Set the packet data.

For details, refer to "7.2 Packet Information".

7) Create new sequence information.

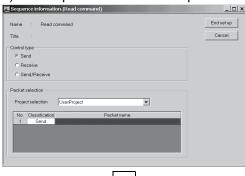

Operation:

Click or choose [Edit] \rightarrow [Sequence information] \rightarrow [New sequence information].

New sequence information is created.

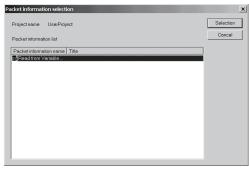

8) Set the packet data to the sequence information.

Double-click "Packet name".

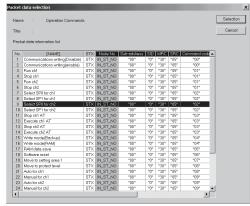

The packet information screen opens.

Select the packet information.

Select the packet to create a protocol FB

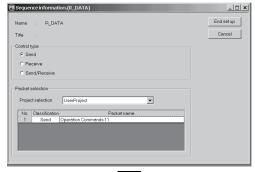

Operation:

Select the packet data information.

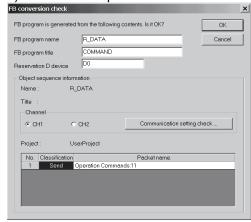

The packet data selected here is created as a protocol FB.

The packet data is set to the sequence information.

9) Convert into a protocol FB.

Operation:

Click or choose [Edit] →

[Sequence information] → [FB conversion of sequence information].

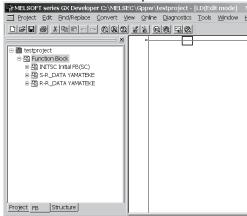

Input the FB program name, etc. and click the OK button.

REMARK

This will create an FB program for the channel specified in "Channel".

The protocol FB and module initialization FB are inserted into the <<FB>> tab of GX Developer.

Inserted into GX Developer.

Point

Precautions for creating multiple module initialization FBs

At the time of [FB conversion of sequence information], a module initialization FB is created under the FB program name of "INITSC". If the module initialization FB (INITSC) exists in a GX Developer's project, the new FB is overwritten to the existing one.

Therefore, when multiple module initialization FBs are needed for respective applications or channels, change the FB program name on GX Developer after [FB conversion of sequence information].

6.5 Operating Procedure for Utilization of Converted FB on GX Developer

The procedure for pasting the protocol FB to a sequence program to create a communication control program will be explained using the actual screen as an example.

The protocol FB is inserted into the <<FB>> tab.

The inserted FB names are the FB name specified in "FB conversion of sequence information" and INITSC (initialization FB).

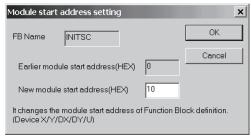

Operation:

Choose [Project] \rightarrow [Function block] \rightarrow [FB Change module address].

The protocol FB has been created with the Q series C24 module installed on Slot 0. If it is not installed on Slot 0, change the module head I/O.

Operation:

Input the module head I/O where the Q series C24 module is installed.

The example assumes that the module is installed on Slot 1.

11) Convert (compile) the protocol FB.

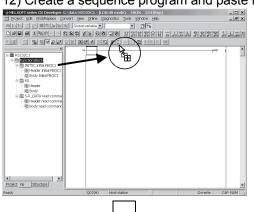

Operation:

 $[Convert] \rightarrow \\ [Convert/Compile (All programs)].$

Since the protocol FB has not yet been convert (not yet been compiled), convert (compile) it before use.

6 - 11 6 - 11

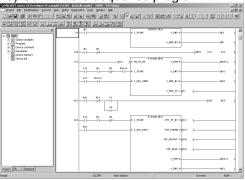

12) Create a sequence program and paste the protocol FB.

Operation:

- (1) Put the sequence program in the edit condition.
- (2) Open the <<FB>> tab and drag the desired program FB to the sequence program.
- (3) Create the I/O area of the pasted protocol FB to complete the communication control program.

The protocol FB is pasted to the sequence program.

Operation:

 $[Convert] \rightarrow [Convert/Compile].$

Since the sequence program has not yet been convert (not yet been compiled), convert (compile) it before use.

7 SETTING OF PROTOCOL FB DATA

7.1 Module Setting

PURPOSE

Set various parameters necessary for the initial setting of the Q series C24 module. The settings are reflected on the "Module initialization FB" and "Protocol FB" at the FB conversion of sequence information.

Various parameters are as indicated below.

Mode change

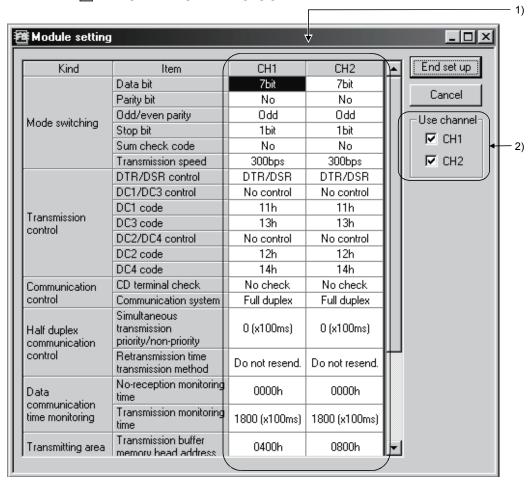

- · Data communication time monitoring
- Transmission control
- Transmitting area
- Communication control
- Data reception
- · Half duplex communication control · Reception area

BASIC OPERATION

- 1. Click the [Edit] → [Module setting] menu ().
- 2. Set various parameters and used channels on the Module setting screen.
- 3. Click the End set up button.
- 4. The module information is set.

7 - 1 7 - 1

DISPLAY/SETTING DETAILS

No	Item	Display/Setting Details
4)	Module setting items	Set the setting items of the module.
		The input methods are as follows.
1)		· Decimal : 0 to 9
		· Hexadecimal : 0 to 9, A to F, a to f
2)	Use channel	Set the used channels in the check boxes.

- The module can be initialized using either of the "module initialization FB" and "module initialization by intelligent function utility" (hereafter abbreviated to the "module initialization by utility"). Note the following points since the initialization timing differs.
- "Module initialization FB"
 Initializes the module when the module initialization FB is executed. Use this FB to initialize the module during program execution.
- "Module initialization by utility"
 Initializes the module when the CPU is reset.
 Since matching with the protocol FB may be lost, do not use this FB when using the protocol FB.
- If the module is not initialized with the "module initialization FB", always make module setting.

7

7.2 Packet Information

Set the packet construction information (message format) and packet data (message) for communication with the device controller.

7.2.1 Creating new packet information

PURPOSE

Used to create new packet construction.

New packet construction cannot be created in the system project. Execute this function in the user project.

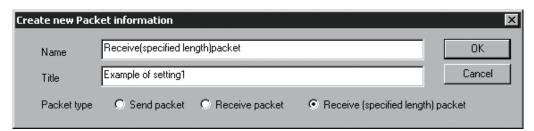

BASIC OPERATION

- 1. Click the [Edit] \rightarrow [Packet information] \rightarrow [New Packet information] menu ($\stackrel{\$\$}{}$).
- 2. The Create new packet information screen is displayed.
- 3. Set the "Name", "Title" and "Packet type", and click the OK button.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/Setting Details		
	Set the name of packet information.		
Name	The number of usable characters is within 32.		
	For restrictions on name, refer to Appendix 2.		
	Set the title of packet information.		
Title	The number of usable characters is within 32.		
	For restrictions on name, refer to Appendix 2.		
	Select the packet type from the following.		
Packet type	Send packet/Receive packet/Receive (specified length) packet.		
	The packet type cannot be changed after packet information creation.		

7 - 3 7 - 3

Specifying Receive packet/Receive (specified length) packet

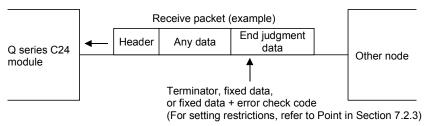

Specify either of the following types according to the packet construction or final data to be received.

(1) Receive packet

Specify this type to create a receive frame that includes header, any data and end judgment data.

The following shows the construction of the receive packet supported by GX Configurator-SC.

• Header + Any data*1 + End judgment data*2

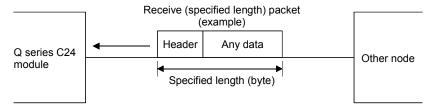

(2) Receive (specified length) packet

Specify this type to create a receive frame with fixed packet length, header and no end judgment data.

The following shows the construction of the receive (specified length) packet supported by GX Configurator-SC.

Header + Any data *1

- *1: Any data indicates the data located behind header of the packet sent from other node, or between the header and end judgment data. This data can be omitted. Fixed data and output variables are used as any data when receiving data.
- *2: End judgment data is used to identify the final data of each packet when the Q series C24 module receives and processes the packet (data array) sent from other node.

The following shows the combination of end judgment data.

- Terminator only
- Fixed data only
- Fixed data + error check code

For example, CR (code: ODH) and ETX (code: 03H) data can be used as end judgment data.

7.2.2 Opening the packet construction information

PURPOSE

Read the packet construction information already set. Used to change the contents of the packet construction information.

The packet construction information of the system project cannot be changed.

When it is desired to reuse it, make a duplicate.

For details, refer to "7.2.5 Duplicating the packet information".

BASIC OPERATION

- 1. Click the [Edit] \rightarrow [Packet information] \rightarrow [Open Packet construction information] menu (📆).
- 2. The Packet construction information screen is displayed.

7 - 5 7 - 5

7.2.3 Setting the packet construction information

PURPOSE

In the packet construction information, set each item of the packet construction (message format). The protocol FB support function sets the packet on the basis of this information.

The setting items are the item name, data classification, data type and data length.

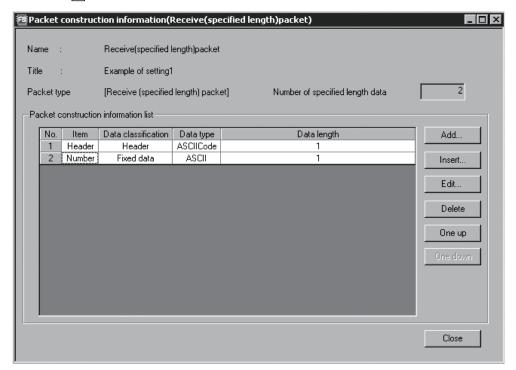

BASIC OPERATION

- 1. Click the [Edit] → [Packet information] → [Open Packet construction information] menu ().
- 2. The Packet construction information screen is displayed.
- 3. Click the Add or Insert button to display the Packet construction information setting screen.
- 4. After the setting of the Packet construction information setting screen is completed, click the Setting button.
- 5. The data are set to the Packet construction information screen.
- 6. Click the Close button on the Packet construction information screen.

DISPLAY/SETTING SCREEN

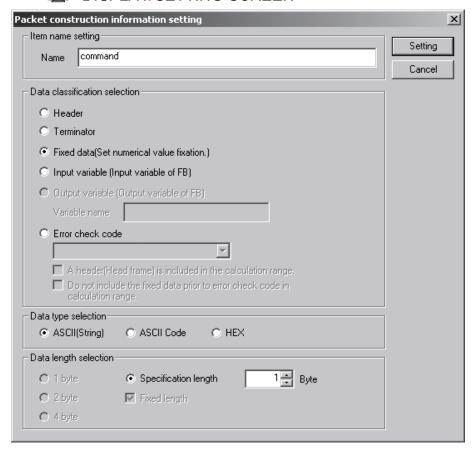

7 - 6 7 - 6

DISPLAY/SETTING DETAILS

Item	Display/Setting Details
Name	The name of the packet information is displayed.
Title	The title of the packet information is displayed.
Packet type	The packet type of the packet information is displayed.
Number of specified length data	Displays the data length set in the packet construction information setting only when the packet type is Receive (specified length) packet.
Packet construction information list	The packet construction elements set in the packet construction information setting are displayed.
Add button	Adds the item of the packet construction. Displays the Packet construction information setting screen and sets the packet construction information. Data are inserted into the position one line lower than the cell containing the focus.
Insert button	Inserts the item of the packet construction. Displays the Packet construction information setting screen and sets the packet construction information. Data are inserted into the position one line higher than the cell containing the focus.
Edit button	Edits the item of the packet construction information already set.
Delete button	Deletes the specified item.
One up button	Moves the set packet construction information item one place up.
One down button	Moves the set packet construction information item one place down.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/Setting Details
ltono nono cottino	Set the name of the item to be added or changed.
Item name setting	The usable number of characters is within 32 characters.
Data classification selection	Select the data classification to be added or changed with the radio button. <in case="" of="" packet="" receive="" send="" the=""> (1) Header (2) Terminator (3) Fixed data (4) I/O variable Set the variable name corresponding to the I/O label of the protocol FB after FB conversion (compile). (5) Error check code Set the error check code type and calculation range. a) Error check code type · Horizontal parity (2 bytes) ASCII · Horizontal parity (1 byte) BIN *1 · 2's complement (2 bytes) ASCII · SUM (1 byte) BIN · SUM (2 bytes) BIN · SUM (2 bytes) ASCII · SUM (2 bytes) ASCII · SUM (2 bytes) ASCII · SUM (2 bytes) ASCII SUM (2 bytes) ASCII SOM (2 bytes) ASCII SOM (2 bytes) ASCII SOM (3 bytes) ASCII SOM (4 byte) BIN SOM (5 bytes) ASCII SOM (6 bytes) ASCII SOM (7 bytes) ASCII BOM (8 bytes) ASCII BOM (9 bytes) ASCII BOM (9 bytes) ASCII BOM (1 bytes) ASCII BOM (1 bytes) ASCII BOM (1 bytes) ASCII BOM (1 bytes) ASCII BOM (2 bytes) ASCII BOM (1 bytes) ASCII</in>
Data type selection	conversion (compile). Select the data type of the item to be added or changed. Selection is disabled when the error check code is selected.
Data length selection	 Select the data length of the item to be added or changed. Selection is disabled when the error check code is selected. When ASCII (character string) or ASCII Code is selected in Data type selection, the data length can be set to 1 to 50 bytes. However, when the input variable or output variable is selected in Data type selection, the data length than can be set is 1 to 49 bytes. Check Fixed length to achieve the data length set in Specified length after selection of the input variable or output variable. When it is not checked, the data length will be the variable length within the range set in Specified length. However, variable length setting is not available when Receive (specified length) packet is selected.

7 - 8 7 - 8

- * 1: "Horizontal parity (1 byte) BIN" can be set when using the following module:
 - QJ71C24, QJ71C24N-R2 or QJ71C24N-R4
- *2: The following table explains calculation ranges for the error check code in the basic packet structure.

 Note that "Do not include the fixed data prior to error check code in calculation range" can be set only when "SUM (2 bytes) ASCII" is set for the error check code.

	Calculation	range setting				
	A header (Head frame) is included in the calculation range	Do not include the fixed data prior to error check code in calculation range	Basic p	acket structure and error	check code	e calculation range
1			Header	I/O variable	Fixed data	Error check code Terminator
	Not checked	Not checked		Error check code calculat	ion range	•
2	V		Header	I/O variable	Fixed data	Error check code Terminator
	Checked	Not checked	Error ch	eck code calculation range	→	
		□	Header	I/O variable	Fixed data	Error check code Terminator
3	Not checked	Checked		Error check code		
				calculation range	l otal byte	es of 2 data are up to 78.
4	☑	☑	Header	I/O variable	Fixed data	Error check code Terminator
-	Checked	Checked	Error ch	neck code calculation range	Total byte	es of 2 data are up to 78.

*3: "Do not include the fixed data prior to error check code in calculation range" can be check-marked when using the following module (software version E or later):

QJ71C24, QJ71C24N-R2 or QJ71C24N-R4

When a module other than the above is used, messages will not be sent or received properly even if "Do not include the fixed data prior to error check code in calculation range" is checked.

- Restrictions on the packet construction items at the time of packet construction information setting
- The maximum used items are 32 items.
- The number of items usable for input variables is up to 8 items.
- The number of items usable for output variables is up to 19 items. When multiple output variables are to be set, the output variable that can be set to a variable length is only the last output variable.
- Restrictions on the packet construction when FB conversion is performed from sequence information
- <In the case of send packet>

The maximum size of the send packet is 255 bytes.

The number of registrations (number of bytes) of each item is within the following ranges.

A = number of bytes of items other than the input variable \times 3

B = number of items for input variables (label variables) \times 30

The packet cannot be created if A + B exceeds 270.

<In the case of receive packet>

The packet data requires the header, the error check code or terminator.

When multiple output variables are to be set, the output variable that can be set to a variable length is only the last output variable.

The maximum size of the receive packet is 255 bytes.

The number of registrations (number of bytes) of each item is within the following ranges.

A = number of bytes of items other than the output variable \times 3

B = number of items for output variables (label variables) \times 17

The packet cannot be created if A + B exceeds 340.

- * Add all packet information set to the sequence information.
- Restrictions on the order of packet construction information on a data classification basis
 - <Header>

Always set the header at the beginning of the packet data.

No other data can be inserted before the header.

<Terminator>

Always set the terminator at the end of the packet data.

No other data can be added after the terminator.

<I/O variable>

Set it between a header and error check code.

- For a receive packet, I/O variable cannot be set at the top or end of packet data.
- For a receive (specified length) packet, I/O variable cannot be set at the top of packet data.
- <Fixed data>

Set it between a header and terminator.

<Error check code>

When a terminator exists, set an error check code before the terminator. When setting an error check code at the end of packet data, set fixed data immediately before the error check code.

Restrictions on the variable name of the input variable/output variable
 Refer to Appendix 3 for details.

7 - 10 7 - 10

7.2.4 Setting the packet data information

PURPOSE

According to the packet construction information, set detailed data to the construction elements of the packet construction information to set the actually transmitted data.

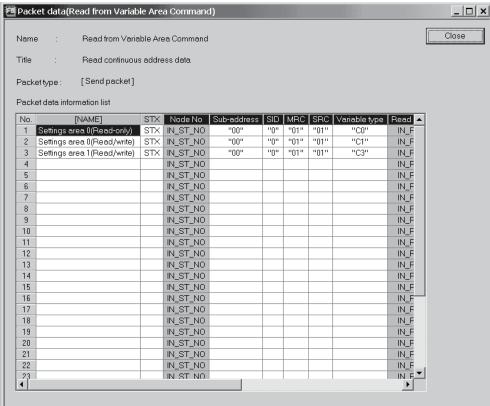

BASIC OPERATION

- 1. Click the [Edit] → [Packet information] → [Open packet data information] menu
- 2. The Packet data information screen is displayed.
- 3. Input a name into the [NAME] field of the packet data information list.
- 4. Set the detailed data of the construction elements set in the packet construction information.
 - When the data type is "ASCII Code", the "ASCII Code input" dialog is
 - The grayed areas need not be set since the data of the input/output variables (input/output variables of FB) set in the packet construction information setting are inserted.
- 5. Click the Close button to entry the data.

DISPLAY/SETTING SCREEN

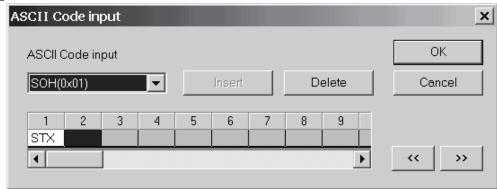

7 - 11 7 - 11

DISPLAY/SETTING DETAILS

Item	Display/Setting Details	
Name	The name set in the creation of new packet information is displayed.	
Title	The title set in the creation of new packet information is displayed.	
Packet type	The packet type set in the creation of new packet information is displayed.	
Packet data information list	Set the [NAME] field to differentiate between packet data.	
[NAME]	The usable number of characters is within 32 characters.	
	Set data on a construction element basis.	
Packet data information list	Set these data according to the data of the packet construction information.	
Packet data information list	Up to 32 patterns of data can be set to one packet construction.	
	The item whose first line is blue is in the calculation range of the "error check code".	

DISPLAY/SETTING SCREEN

	• NUL (0x00) to US (0x1F) • DEL (0x7F)
Insert button	Inputs the selected ASCII code into the cursor position.
Delete button	Deletes the ASCII code in the cursor position.
<< · >> button	Moves the cursor position left to right in the already input ASCII code list.

7 - 12 7 - 12

7.2.5 Duplicating the packet information

PURPOSE

Duplicate the packet information. Use this function when reusing the already set packet information. When reusing the system project, execute this function after creating a user project. When this function is executed on the system project side, the packet information is inserted into the user project.

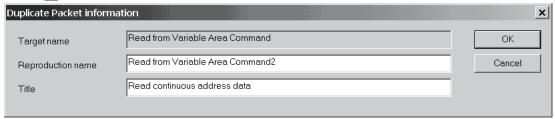

BASIC OPERATION

- 1. Put the packet information to be duplicated in a selected condition, and click the $[Edit] \rightarrow [Packet information] \rightarrow [Duplicate packet information] menu.$
- 2. Set the "Reproduction name" and "Title" and click the OK button. The packet information is duplicated.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/Setting Details

	Set a new name.	
Changed name	The usable number of characters is within 32 characters.	
T:41 -	Set the title.	
Title	The usable number of characters is within 32 characters.	

7.2.7 Deleting the packet information

PURPOSE

Delete the packet information. When the packet information to be deleted is used in the sequence information, the data entered in the sequence information is deleted. Execute this function after changing the data of the sequence information.

BASIC OPERATION

- 1. Click the [Edit] \rightarrow [Packet information] \rightarrow [Delete packet information] menu.
- 2. A confirmation message is displayed before the deletion of the packet information is executed.

Click the Yes button to delete the packet information.

7 - 14 7 - 14

7.3 Sequence Information

In the sequence information, set the communication processing control type (send, receive, send/receive) and the packet data that matches the control type to set the information for creating a protocol FB.

7.3.1 Creating new sequence information

PURPOSE

Create new sequence information.

New sequence information cannot be created in the system project. Execute this function in the user project.

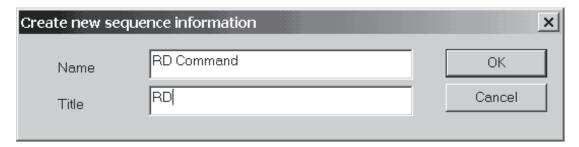

BASIC OPERATION

- 1. Select "Sequence information" in the project tree, and click the [Edit] \rightarrow [Sequence information] → [Create new sequence information] menu ().
- 2. The New sequence information screen is displayed. Set the "Name" and "Title" and click the OK button.
- 3. New sequence information is created.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

REMARK

Refer to Appendix 2 for the restrictions on the set names, etc.

7 - 15 7 - 15

7.3.2 Setting the sequence information

PURPOSE

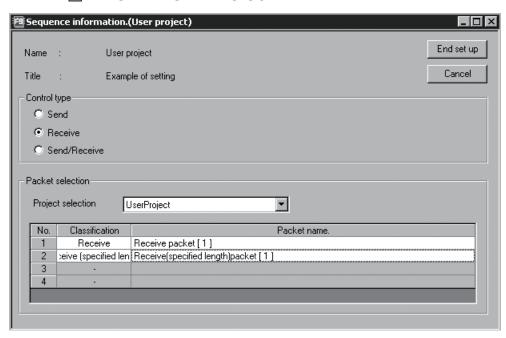

In the sequence information, set the communication processing control type (send, receive, send/receive) and the packet data that matches the control type to set the information for creating a protocol FB.

BASIC OPERATION

- 1. Click the [Edit] → [Sequence information] → [Open sequence information]
- 2. The Sequence information screen is displayed.
- 3. Set the "Control type", "Project selection" and "Classification".
- 4. Double-click the "Packet name" cell to display the Packet information selection screen.
- 5. Make setting and click the End set up button.
- 6. The settings are entried.

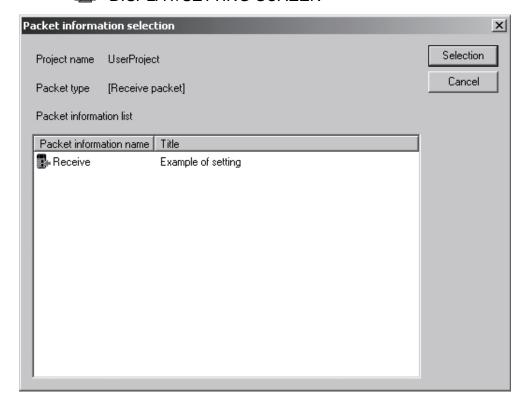

7 - 16 7 - 16

DISPLAY/SETTING DETAILS

Item	Display/Setting Details	
Name Displays the name set in the creation of the sequence information.		
Title	Displays the title set in the creation of the sequence information.	
Control type	Select the control type.	
Project selection	Select the project for selection of the packet information.	
Classification	Select the classification that can be set by making control type selection. Click the Classification cell and make selection from the combo box.	
Packet name.	After moving the focus to the specified cell, double-click. 1) The Packet information selection screen is displayed. Select the packet information. 2) The Packet data selection screen is displayed. Select the packet data.	

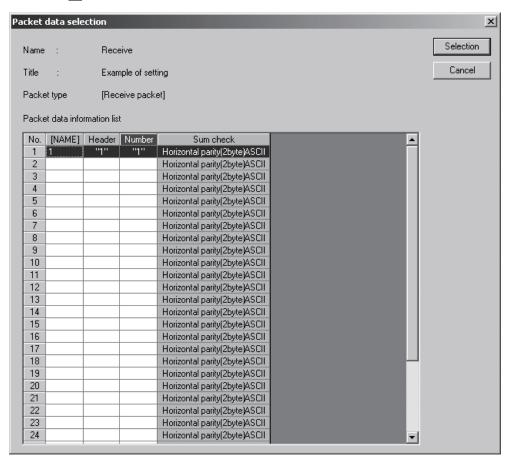

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/Setting Details
Packet information list	Displays the packet information that can be selected. After making selection with the cursor, click the Selection button.
Selection button	Displays the packet information selected with the cursor. Displays the Packet data selection screen.
Cancel button	Cancels the setting and closes the screen.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/Setting Details		
Packet data information list	Displays the packet information that can be selected. After making selection with the cursor, click the Selection button. The item whose first line is blue is in the calculation range of the "error check code".		
Selection button	Sets to the sequence information the packet data information selected with the cursor. Returns to the Sequence information screen.		
Cancel button	Cancels the setting and closes the screen.		

7 - 18 7 - 18

7.3.3 Duplicating the sequence information

PURPOSE

Duplicate the sequence information. Use this function when reusing the already set sequence information. When reusing the system project, execute this function after creating a user project. When this function is executed on the system project side, the sequence information is inserted into the user project.

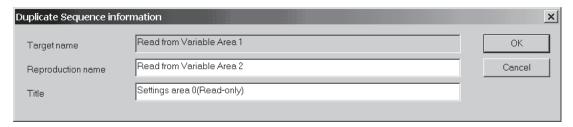

BASIC OPERATION

- 1. Click the [Edit] → [Sequence information] → [Duplicate sequence information] menu.
- 2. Set the "Reproduction name" and "Title" and click the OK button. The sequence information is duplicated.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/Setting Details	
Target name	Displays the target name.	
Reproduction name	Set the reproduction name.	
	The usable number of characters is within 32 characters.	
Title	Set the title.	
	The usable number of characters is within 32 characters.	

7 - 19 7 - 19

7.3.4 Renaming the sequence information

PURPOSE

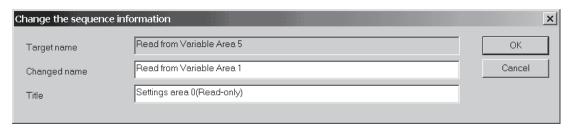

Rename the sequence information.

BASIC OPERATION

- 1. Click the [Edit] \rightarrow [Sequence information] \rightarrow [Rename sequence information]
- 2. Set the "Changed name" and "Title" and click the OK button. The sequence information is renamed.

DISPLAY/SETTING DETAILS

Item	Display/Setting Details	
Target name	Displays the target name.	
Changed name	Set a new name.	
	The usable number of characters is within 32 characters.	
Title	Set the title.	
	The usable number of characters is within 32 characters.	

7 - 20 7 - 20

7.3.5 Deleting the sequence information

PURPOSE

Delete the sequence information.

BASIC OPERATION

- 1. Click the [Edit] \rightarrow [Sequence information] \rightarrow [Delete sequence information] menu.
- 2. A confirmation message is displayed before the deletion of the sequence information is executed.

Click the Yes button to delete the sequence information.

7 - 21 7 - 21

7.3.6 Confirming the I/O variables

PURPOSE

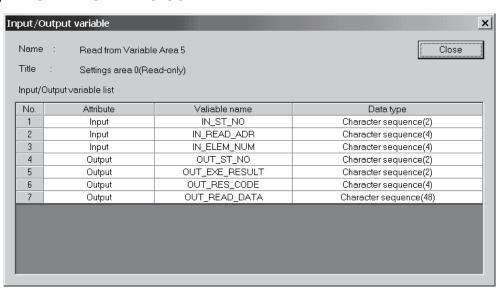

Display a list of the input/output variables used in the packet information selected in the sequence information. The input/output variables displayed here are defined as the sequence FB variables of a protocol FB.

BASIC OPERATION

- 1. Click the [Edit] \rightarrow [Sequence information] \rightarrow [Input/Output variable] menu.
- 2. The Input/Output variable screen is displayed.
- 3. The data set in the packet construction information setting are displayed in the Input/Output variable list.

DISPLAY/SETTING SCREEN

7 - 22 7 - 22

7.4 FB Conversion of Sequence Information

PURPOSE

Convert the sequence information into an FB program. There are three different FB program types: initialization FB, send FB*1 and receive FB*2.

- *1: Send FB: When Send or Send/Receive is selected as the control type in the sequence information
- *2: Receive FB: When Receive or Send/Receive is selected as the control type in the sequence information

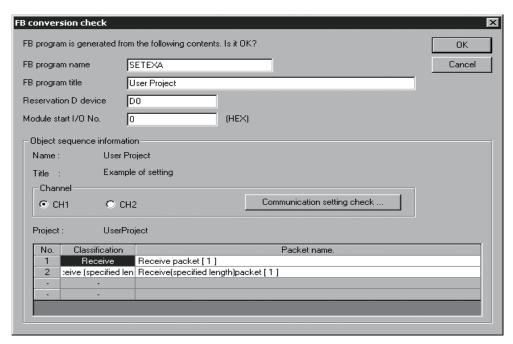

BASIC OPERATION

- 1. Click the [Edit] → [Sequence information] → [FB conversion of sequence information] menu (**).
- 2. The FB conversion screen is displayed.
- 3. Set the "FB program name", "FB program title", "Reservation D device" and "Module start I/O No.".
- 4. Select the channel used for the target sequence information.
- 5. Click the Communication setting check button and confirm the data of the object module.
- 6. Click the OK button.
- 7. The protocol FB is created and inserted into the <<FB>> tab of GX Developer.

DISPLAY/SETTING SCREEN

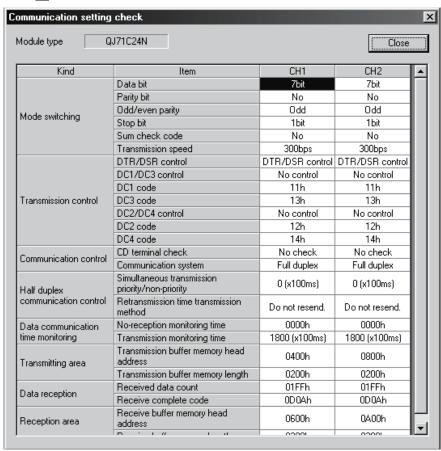

7 - 23 7 - 23

DISPLAY/SETTING DETAILS

Item	Display/Setting Details			
FB program name	Set the name to the protocol FB. The name set here is used as the FB name. The usable number of characters is within 6 characters. The FBs are displayed on GX Developer as indicated below. • Send FB: S-***** • Receive FB: R-*****			
FB program title	Set the title to the protocol FB. The title set here is used as the FB title. The usable number of characters is within 32 characters.			
Reservation D device	Set the D device to be used in the protocol FB to be output. Since the specified D device (2 words) is used in the FB, it cannot be used in the sequence program.			
Module start I/O No.	Set the head address of the module used in the FB program to be output. The FB program will be generated depending on the head address set here. The setting range varies with the PLC CPU used. Therefore, make the settings within the following range. Q00JCPU : 0 to E0 Q00CPU/Q01CPU : 0 to 3E0 Other QCPU (Q mode) : 0 to FE0			
Channel	Specify the target channel of the sequence information (protocol FB).			
Communication setting check button Displays the communication settings. The display data are the setting the Module setting screen.				
Classification	Displays the data of the sequence information.			
Packet name	Displays the data of the sequence information.			

DISPLAY/SETTING SCREEN

7 - 24 7 - 24

8

8 HOW TO USE PROTOCOL FB

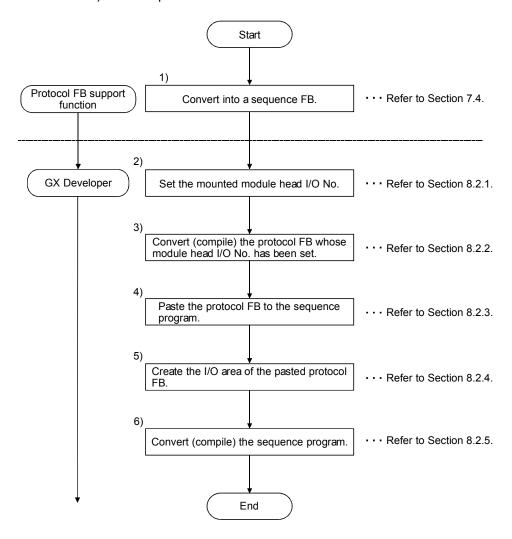

This chapter explains the procedure to use protocl FB with GX Developer.

8.1 Outline

The procedure to create and use protocol FBs is described below.

- 1) Convert the sequence information into a sequence FB.
- 2) Set the module head I/O No. of the protocol FB created by sequence FB conversion.
- 3) Convert (compile) the protocol FB whose module start I/O No. has been set.
- 4) Paste the protocol FB to the sequence program.
- 5) Create the I/O area of the pasted protocol FB.
- 6) Convert (compile) the sequence program.

The procedure of steps 1) to 6) will now be represented in a flowchart. The details of 1) to 6) will be explained in the next section.

8.2 How to Use Protocol FBs on GX Developer

When sequence information is converted into sequence information FBs, the following three different protocol FBs are inserted into GX Developer.

- 1) Module initialization FB: INITSC
- 2) Send FB: S-****
- 3) Receive FB: R-****
- ***** is the name of the protocol FB set at the time of sequence information FB conversion.

A communication control program can be created by creating the I/O areas of the protocol FBs inserted into GX Developer. The procedure will now be explained.

8.2.1 Module start I/O No. setting

Since the created protocol FB has the module start I/O No. of 0, change the module start I/O No. according to the mounting position of the module.

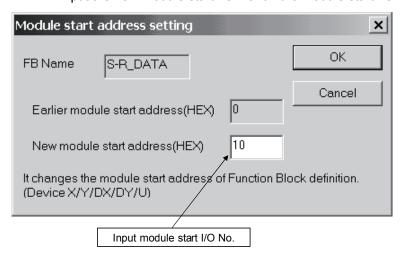

PURPOSE

Set the module start I/O No. of the protocol FB.

BASIC OPERATION

- 1. Open the target FB program on GX Developer.
- 2. Change to the write mode.
- 3. Click the [Project] → [Function block] → [Module start I/O No. setting] menu.
- 4. Input the new module start I/O No. on the Module start I/O No. setting screen.

With GX Configurator-SC Version 2.04E (SW2D5C-QSCU) or latter, the module start I/O No. can be set when sequence information are converted into FB program. For details of setting method, refer to Section 7.4.

8

8.2.2 Converting (compiling) the protocol FB whose module start I/O No. was set

PURPOSE

Convert (compile) the protocol FB, whose module start I/O No. was set, so that it can be used on GX Developer.

BASIC OPERATION

Click the [Convert] → [Convert/Compile] menu of GX Developer. For details, refer to the "GX Developer Operating Manual (Function Block)".

8.2.3 Pasting the protocol FB to the sequence program

PURPOSE

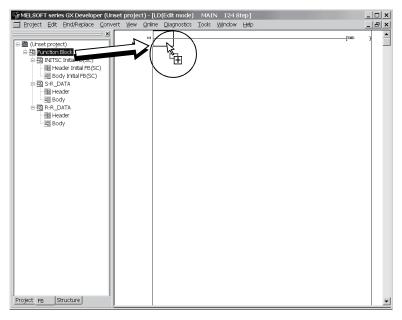

Paste the protocol FB to the sequence program for use in it.

BASIC OPERATION

Switch from the <<Pre>roject>> tab to the <<FB>> tab of GX Developer, and drag and drop the protocol FB to be used onto the sequence program.

For details, refer to the "GX Developer Operating Manual (Function Block)".

8.2.4 Creating the I/O areas of the pasted protocol FBs

There are the following two different I/O variable types for protocol FBs. Using these I/O variables, create a communication control program.

- 1) I/O variables created by the protocol FB support function
- 2) I/O variables used by the user in the sequence information

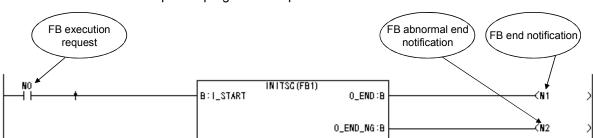

- For the I/O variables of the protocol FBs created from the system project, refer to "11 SEQUENCE INFORMATION AND LABEL VARIABLES OF SYSTEM PROJECT".
- The I/O variables used in the sequence information can be confirmed on the Input/Output variable screen. For details, refer to "7.3.6 Confirming the I/O variables".

How to use the I/O variables of the module initialization FB, send FB and receive FB will now be explained.

(1) Module initialization FB

The module initialization FB has the following I/O variables. Using these I/O variables, make the initial setting of the Q series C24 module.

No.	I/O variable	Description	Input/Output
1	I_START	FB execution request: Turn ON to start the module initialization processing.	Input
2	O_END	FB end notification: Turns ON at completion of the initialization processing. Also turns ON at abnormal completion.	Output
3	O_END_NG	FB abnormal end notification: Turns ON at abnormal completion only.	Output

The sequence program example that uses the module initialization FB is shown below.

Point

- The module initialization FB is the FB that initializes the module. Always execute it before using the send or receive FB.
- When the module is initialized directly by the sequence program, the module need not be initialized using the module initialization FB.

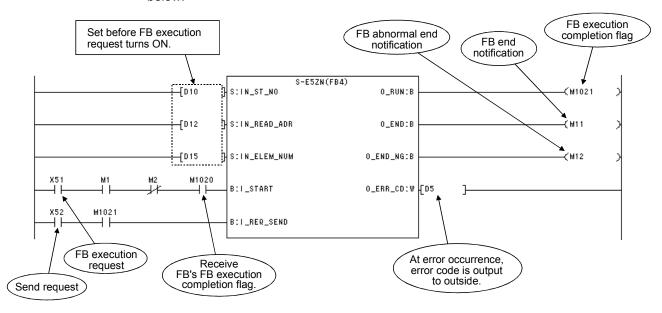

(2) Send FB

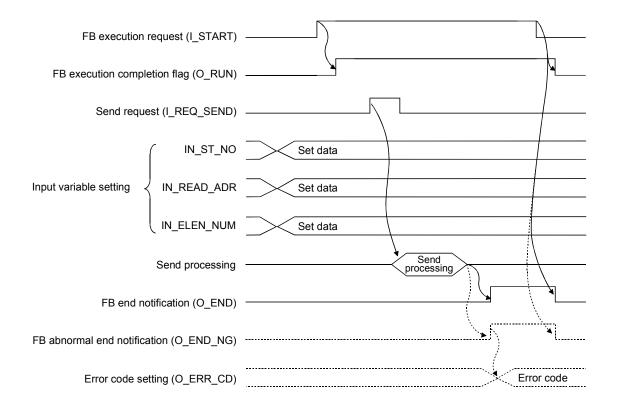

The send FB has the following I/O variables. Data can be sent using these I/O variables and the input variables set in the sequence information.

No.	I/O variable	Description	Input/Output
1	I_START	FB execution request: Turn ON to start the FB.	Input
2	I_REQ_SEND	Send request: Turn ON to execute send.	Input
3	O_RUN	FB execution completion flag: Turns on at completion of send preparation. *1 Out	
4	O_END	FB end notification: Turns ON at completion of send. Also turns ON at abnormal completion.	Output
5	O_END_NG	FB abnormal end notification: Turns ON at abnormal completion only.	
6	O_ERR_CD	Error code: The error code at abnormal completion is stored. For details of the error codes, refer to the "Q Corresponding Serial Communication Module User's Manual (Basics)".	

*1: FB execution completion flag (O_RUN) is an output variable for interlock. It is added from SW2D5C-QSCU-E, Version 2.14Q.

The sequence program example that uses the send FB and its timing chart are shown below.

(3) Receive FB

The receive FB has the following I/O variables. Data can be received using these I/O variables and the output variables set in the sequence information.

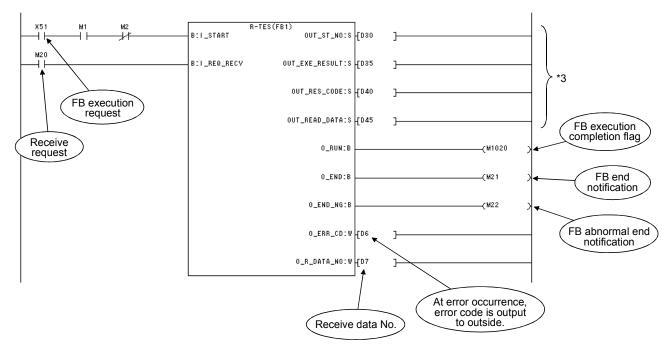

No.	I/O variable	Description	Input/Output
1	I_START	FB execution request: Turn ON to start the FB.	Input
2	I_REQ_RECV	Receive request: Turn ON to enable receive.	Input
3	O_RUN	FB execution completion flag: Turns on at completion of receive preparation. *2	Output
4	O_END	FB end notification: Turns ON at completion of receive. Also turns ON at abnormal completion.	Output
5	O_END_NG	FB abnormal end notification: Turns ON at an abnormal end only. When it has turned ON, refer to the error code (O_ERR_CD).	Output
6	When O_END_NG is ON, either of the following error codes is stored. O_ERR_CD = 0]: Receive packet size error The received packet size is outside the range of the set packet construction size. O_ERR_CD ≠ 0]: Module detection error Refer to the "Q Corresponding Serial Communication Module User's Manual (Basics)".		Output
7	O_R_DATA_NO Receive data No.: When the receive packet entried on the Sequence information screen matches the receive data, that packet No. (1 to 4) is stored. On a mismatch, "0" is stored.		Output

^{*2:} FB execution completion flag (O_RUN) is an output variable for interlock. It is added from SW2D5C-QSCU-E, Version 2.14Q.

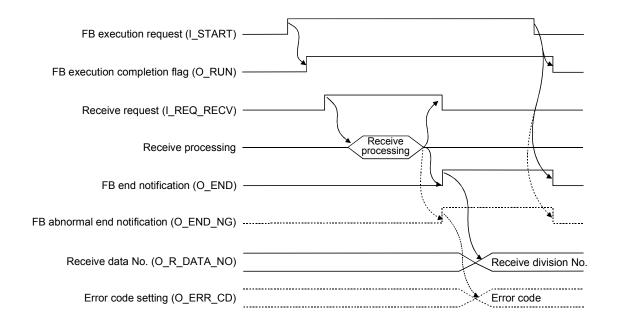

- (1) When using the receive FB and send FB in the sequence program, create a program in which the input variable, I_START of the receive FB turns on earlier than or at the same time as I_START of the send FB.
- (2) When multiple send FBs exist, do not execute 2 or more send FBs concurrently. (Do not create a program in which more than one I_START of send FBs will turn ON at the same time.)
 - Also, when multiple receive FBs exist, do not execute 2 or more receive FBs concurrently. (Do not create a program in which more than one I_START of receive FBs will turn ON at the same time.)
 - Doing so will result in abnormal operation and only the processing based on the send/receive FB executed at the last will be executed.
- (3) When executing receive FB and send FB concurrently, execute the send processing after FB execution completion flag (O_RUN) of receive FB turns on. Executing the send processing before FB execution completion flag of receive FB turns on causes the error in the module. (Error code: 7FF5H)

*3: Variables used when output variables are specified by the user in the packet construction information

About echo data

Since a two-wire transmission path receives send data by itself, the first receive data must be ignored. This processing is not performed in the protocol FBs. Therefore, perform programming so that echo data is ignored in the sequence program.

Specifically, receive data can be ignored by turning ON Receive read completed (Yn1) on the first leading edge of Receive read request (Xn3) or Receive error detection (Xn4) of the Q series C214 module I/O signal.

However, when the packet construction of the send data differs from that of the receive data (head differs), no special measures are not required since the receive of the echo data can be ignored on the Q series C24 module side.

For details of Receive read request, Receive error detection and Receive read completed, refer to the "Q Corresponding Serial Communication Module User's Manual (Basics)".

8.2.5 Converting (compiling) the sequence program

PURPOSE

Convert (compile) the sequence program, where protocol FBs have been pasted, to make it executable.

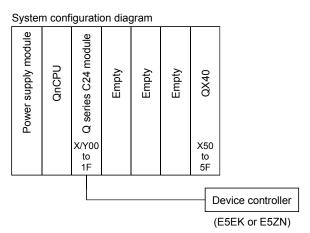

BASIC OPERATION

Click the [Convert] \rightarrow [Convert/Compile] menu of GX Developer.

8.3 Sequence Program Example Using Protocol FBs

This section provides the program examples including protocol FBs and the timing charts by use of the following system configuration and devices.

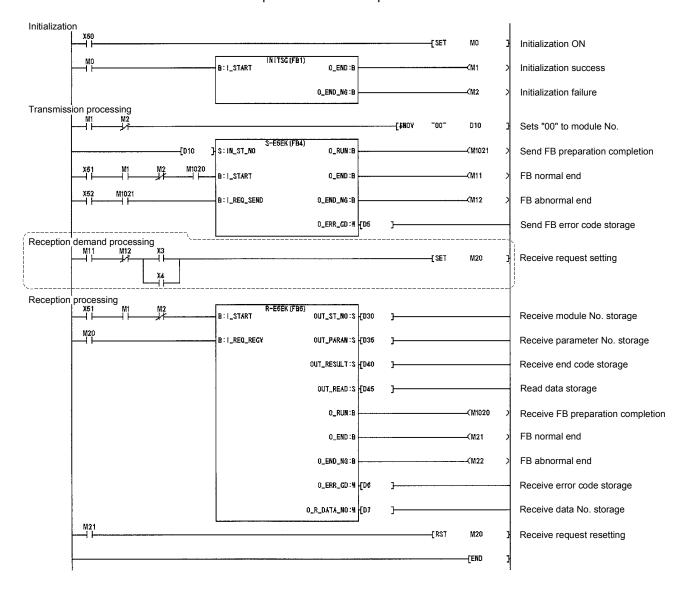

Used device list

Device name		Device	Description	Device name	Device	Description
Input/	Input	X3	CH1 read detection		X50	Initial start command
output	input	X4	CH1 receive error detection	External input	X51	Send/receive FB start command
of C24	Output	Y1	CH1 read completion		X52	Send request
		D5	Send FB error code		M0	Initialization FB start
		D6	Receive error code		M1	Initialization FB end
			Receive data No.	e data No.		Initialization FB abnormal end
		D10 Module No.			M11	Send FB end
		D12	Read address		M12	Send FB abnormal end
Doto roo	Data and the		Number of elements	Internal relev	M20	Receive request
Data reg	jistei	D30	Receive module No.	Internal relay	M21	Receive FB end
			D35 Receive parameter No./receive	M22		Receive FB abnormal end
		end code	end code		M1020	Receive FB execution completion
		D40	Receive end code/receive			flag
		response code		N44004	Send FB execution completion	
		D45	Read data		M1021	flag

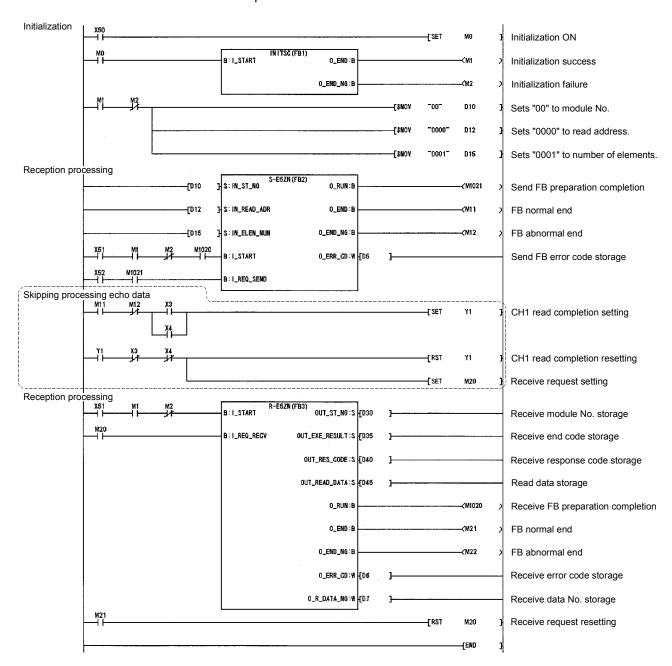

- (1) When using the receive FB and send FB in the sequence program, create a program in which the input variable, I_START of the receive FB turns on earlier than or at the same time as I_START of the send FB.
- (2) When multiple send FBs exist, do not execute 2 or more send FBs concurrently. (Do not create a program in which more than one I_START of send FBs will turn ON at the same time.)
 - Also, when multiple receive FBs exist, do not execute 2 or more receive FBs concurrently. (Do not create a program in which more than one I_START of receive FBs will turn ON at the same time.)
 - Doing so will result in abnormal operation and only the processing based on the send/receive FB executed at the last will be executed.
- (3) When executing receive FB and send FB concurrently, execute the send processing after FB execution completion flag (O_RUN) of receive FB turns on. Executing the send processing before FB execution completion flag of receive FB turns on causes the error in the module. (Error code: 7FF5H)

(1) When there is no echo data skip processing Use the sequence information "parameter read 12" of OMRON's E5EK.

8 - 11 8 - 11

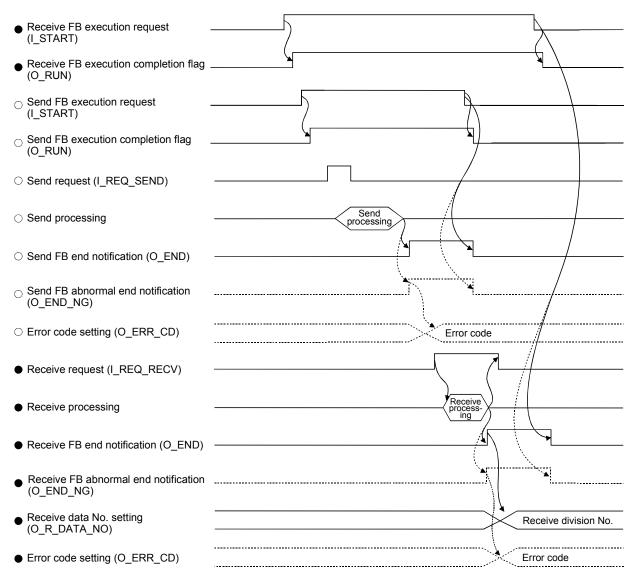

(2) When there is echo data skip processing Use the sequence information "variable area read information 3" of OMRON's.

Refer to Section 8.2.4 for details of the protocol FBs used in the above sequence program examples.

(3) Input/output timing of the send/receive FB

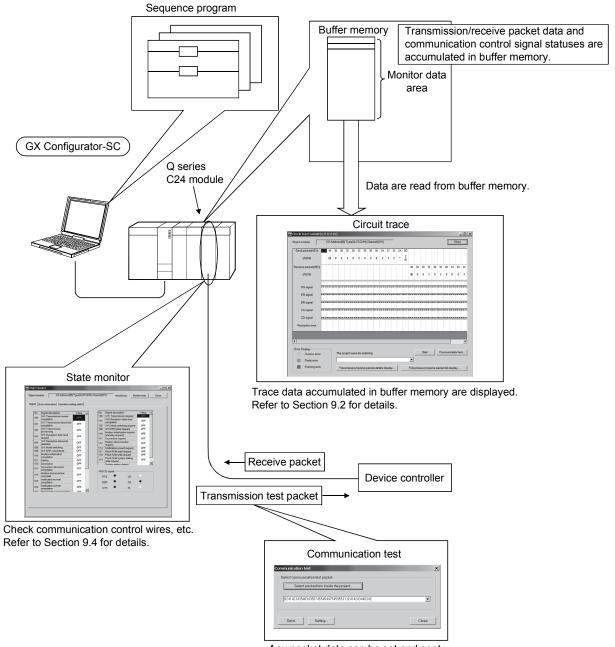

○: Send FB processing •: Receive FB processing

9 DEBUGGING SUPPORT FUNCTIONS

The debugging support functions are designed to support the debugging of communication processing between the Q series C24 module and device controller. The following functions are available to ease system startup work.

- Circuit trace
- Communication test
- State monitor

The following outlines the debugging support functions.

9

Any packet data can be set and sent. Refer to Section 9.3 for details.

9.1 Module Selection

PURPOSE

Select the Q series C24 module to be debugged.

Execute circuit trace, communication test and/or state monitor for the module selected here.

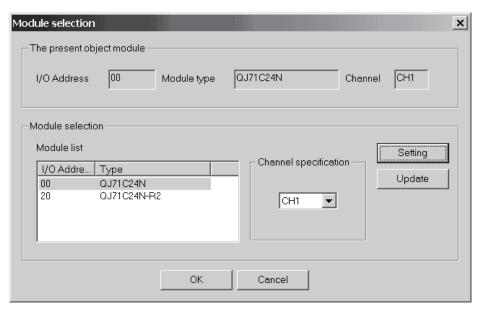

BASIC OPERATION

- 1. Click the [Debugging support function] \rightarrow [Module selection] menu.
- 2. Select the I/O address and channel of the module to be debugged, and click the Setting button.
- 3. Clicking the OK button sets the module information.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/ Setting Details		
The present object module	Displays the information of the selected module.		
Module list	Displays the list of the Q series C24 modules mounted on the same base.		
Channel specification	Select the channel of the module.		
Setting button	Sets the selected module and channel to the Object module.		
Update button	Displays the latest module list.		
OK button	Sets the data displayed in "The present object module" as the object module data.		
Cancel button	Cancels the setting.		

9 - 2 9 - 2

9.2 Circuit Trace

PURPOSE

Trace the communication data and communication control signals between the QJ71C24N, QJ71C24N-R2 or QJ71C24N-R4 module (hereafter abbreviated to the QJ71C24N module) and device controller.

REMARK

The circuit trace function displays the data accumulated in the monitor buffer of the QJ71C24N module.

9.2.1 Starting the circuit trace

PURPOSE

To trace the communication data and communication control signal statuses, store the trace data into the monitor buffer.

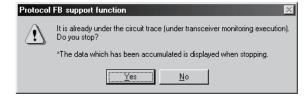

BASIC OPERATION

- 1. Click the [Debugging support function] \rightarrow [Circuit trace] \rightarrow [Circuit trace] menu.
- 2. Click the Start button to start trace.
- 3. When the monitor buffer becomes full or the Stop button is clicked, the trace data are displayed.
- 4. Confirm the transmission and receive packets and communication control signals from the displayed trace result.

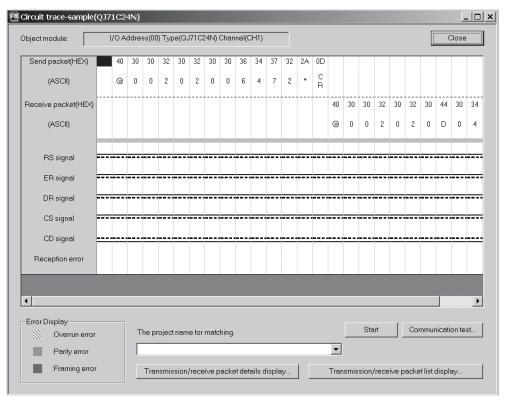

When the circuit trace or communication data monitoring function has already been executed, the following confirmation message is displayed. For details of the communication data monitoring function, refer to the "Q Corresponding Serial Communication Module User's Manual (Applications)".

Item	Display/setting		
Yes button	The circuit trace is stopped and the data already accumulated are read		
	and displayed.		
No button	The dialog box closes. However, the trace is in the as-executed status.		

9 - 3 9 - 3

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Circuit trace screen

Circuit trace screen		
Item	Display/Setting Details	
Object module	Displays the information of the module for which circuit trace will be performed.	
Transmission / reasive maskets	Send data and receive data are displayed, respectively.	
Transmission / receive packets	As the data display format, the ASCII code or hexadecimal can be selected.	
	The RS, ER, DR, CS and CD signal statuses and receive error are displayed as described	
	below.	
	● RS, ER, DR, CS and CD signals	
	All signals are displayed with blue lines	
	When signal is ON∶	
	When signal is OFF: \(\tag{L} \)	
Communication control signals	When the obtained data does not have signal information, the signal is displayed in an	
	OFF status.	
	■ Receive error	
	Three different errors of overrun error, parity error and framing error are displayed.	
	Overrun error: (Green)	
	Parity error : (Light blue)	
	Framing error: (Purple)	
Start button	Starts trace.	
Communication test button	Sends the specified packet from the QJ71C24N module.	
Communication test button	For details, refer to "9.3 Communication Test".	

Item	Display/Setting Details
Stop button	Stops trace. After a stop, the trace data accumulated in the monitor buffer are displayed.
The project name for matching	Select the project to be matched when the transmission/receive packet details display or transmission/receive packet list display is provided. For details, refer to "9.2.3 Transmission/receive packet list".
Transmission/receive packet list display button	Matches the packets displayed in Transmission and receive packets with the packet information of the currently open project and displays the details of the matched packets. For details, refer to "9.2.3 Transmission/receive packet list".
Transmission/receive packet details display button	Displays the list of packets displayed in Transmission and receive packets on a packet basis. For details, refer to "9.2.3 Transmission/receive packet list".
Close button	Closes the Circuit trace screen.

9.2.2 Circuit trace option

PURPOSE

Set the monitor buffer area starting address and size of the QJ71C24N module that will store the circuit trace data.

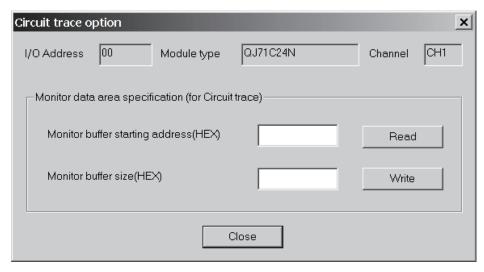

BASIC OPERATION

- 1. Click the [Debugging support function] \rightarrow [Circuit trace] \rightarrow [Circuit trace] menu to display the Circuit trace screen.
- 2. Click the [Debugging support function] \rightarrow [Circuit trace] \rightarrow [Circuit trace] menu to display the Circuit trace option screen.
- 3. Set the "Monitor buffer starting address" and "Monitor buffer size", and click the Write button.

9 - 5 9 - 5

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/Setting Details	
	Set the starting address of the monitor buffer area that will store the trace data. Input the setting in hexadecimal.	
Monitor buffer starting address	● Input range	
setting	CH1: 2600H to 32FDH	
	CH2: 3300H to 3FFDH	
	When the user-specified area is used, set any of C00H to 1AFDH to CH1 or CH2.	
	Set the size of the monitor buffer area that will store the trace data.	
	Input the setting in hexadecimal.	
	● Input range	
Monitor buffer size setting	CH1, CH2: 3 to 1A00 words	
	 When the user-specified area is used, the valid range is the same. 	
	 The value range changes depending on the setting of the "Monitor buffer starting address". 	
Read button	Reads the monitor buffer starting address and size from the selected module.	
Write button	Writes the settings of the "Monitor buffer starting address" and Monitor buffer size" to the selected module.	

9.2.3 Transmission/receive packet list

PURPOSE

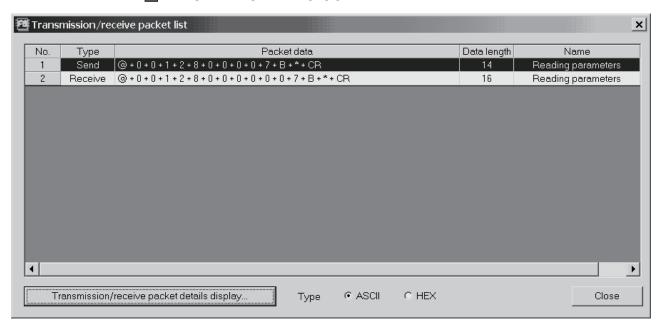

To analyze the transmission and receive packets obtained by circuit trace, display the list of transmission and receive packets.

BASIC OPERATION

- Click the [Debugging support function] → [Circuit trace] → [Circuit trace] menu to display the Circuit trace screen.
- 2. Select the corresponding project of the device controller debugged in "Project name for matching".
- 3. Click the Transmit/receive packet list button on the Circuit trace screen.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/Setting Details
Classification	Displays whether the packet is a transmission packet or receive packet.
Packet data	Displays the transmission/receive packet data.
Data length	Displays the data length (byte) of the transmission/receive packet data.
	Displays the packet names of the packet construction information that matches the corresponding packets. Display Display
Name	1) When there is only one packet that matches: The packet name that matched is displayed. 2) When there are more than one packet that matches: "Match with several packets" is displayed. 3) When there are no packets that match: "No matching packets" is displayed.
Transmission/receive packet details display button	Displays the details of the selected transmission/receive packet configuration.
Display form	Either "ASCII" or "HEX" can be selected as the display format.
Close button	Closes the Transmit/receive packet list screen.

- Packet data matching is performed in the following order.
 - 1) The data length of the packet data is obtained (the variable area has the maximum data length), and whether the full data length is equal to the object packet data length or not is checked.
 - 2) The object packet data is divided in terms of the data length of each item, and whether it is equal to the preset packet data or not is checked.
- The following communication data configurations cannot match.
 - 1) The data is configured by error check codes only.
 - 2) The data starts with an error check code.

REMARK

With the click of the mouse right button, the display data of the Transmission/receive packet list display screen can be copied.

9.2.4 Opening the circuit trace data

PURPOSE

Read and display the trace data saved in the personal computer.

BASIC OPERATION

Click the [Debugging support function] \rightarrow [Open circuit trace data] menu.

9.2.5 Saving the circuit trace data

PURPOSE

Save the trace data obtained by circuit trace into the personal computer.

BASIC OPERATION

Click the [Debugging support function] \rightarrow [Save circuit trace] menu.

9 - 9 9 - 9

9.3 Communication Test

Send any data or preset data from the QJ71C24N module to the device controller to confirm the operation. The communication data result of the communication test can be confirmed on the Circuit trace screen.

The packet data to be sent can be created either by inputting send data directly or by selecting the packet data entered in the project.

Before performing the communication test, set "0" to the following items on the tested channel in "CH \square Non procedure system setting" of the intelligent function module utility.*1

If any other than "0" is set, the communication test will not be performed normally.

- · Output head pointer designation
- · Output count designation
- *1: The setting can be written into the buffer memory from the sequence program. Write "0" into the following 2 areas in the buffer memory.
 - Output head pointer designation (buffer memory address 184 (B8H), 344 (158H))
 - Output count designation (buffer memory address 185 (B9H), 345 (159H))

9.3.1 Communication test after direct input

PURPOSE

Send any data to the device controller.

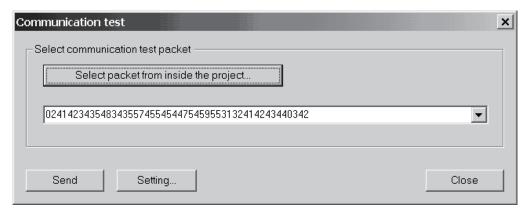

BASIC OPERATION

- Click the [Debugging support function] → [Circuit trace] → [Circuit trace] menu to display the Circuit trace screen.
- 2. Click the Communication test button on the Circuit trace screen to display the Communication test screen.
- 3. Input data directly to the combo box of the Communication test screen in hexadecimal.
- 4. Click the Send button.

9 - 10 9 - 10

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

ltem	Display/Setting Details
Select packet from inside the project button	Displays the Packet data selection screen.
Send data	Displays the packet data to be sent.
Send button	Sends the input packet data.
Setting button	Displays the Communication test setting screen. (Refer to Section 9.3.3.)
Close button	Closes the Communication test screen.

9.3.2 Communication test after selection of packet data

PURPOSE

Select the packet data entered in the project and send them to the device controller.

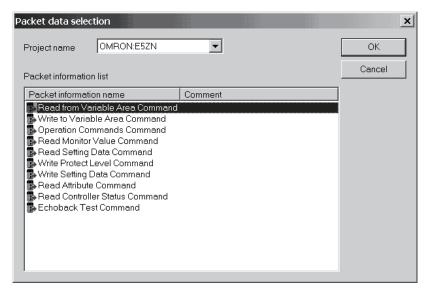

BASIC OPERATION

- Click the [Debugging support function] → [Circuit trace] → [Circuit trace] menu to display the Circuit trace screen.
- 2. Click the Communication test button on the Circuit trace screen.
- 3. Click the Select packet from inside the project button on the Communication test screen to display the Packet data selection screen.
- 4. After selecting the project from the Packet data selection screen, select the packet to be sent, and click the OK button. The Communication test data input screen is displayed.
- 5. Input data from the Communication test data input screen, and click the OK button.
- 6. Click the Send button on the Communication test screen.

Packet details information	Set the packet details information.
OK button	Determines the setting and closes the screen.

9.3.3 Transmission monitoring time designation

PURPOSE

Set the transmission monitoring time to the QJ71C24N module. If receive is not completed within the set time, a send or receive error occurs.

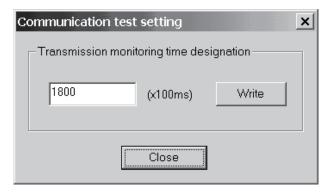

BASIC OPERATION

- Click the [Debugging support function] → [Circuit trace] → [Circuit trace] menu to display the Circuit trace screen.
- 2. Click the Setting button on the Communication test screen. The Communication test setting screen is displayed.
- The currently set transmission monitoring time is displayed.
- 3. Input the transmission monitoring time from the Communication test setting screen, click the Write button, and then click the Close button.

DISPLAY/SETTING SCREEN

DISPLAY/SETTING DETAILS

Item	Display/Setting Details	
	The displayed time is the transmission monitoring time set to the module.	
Transmission monitoring time	Input the transmission monitoring time in units of 100ms.	
	The setting range is 0 to 3000 ($ imes$ 100ms).	
Write button Sets the specified transmission monitoring time to the module.		
Close button	ose button Closes the screen.

9.4 State Monitor

PURPOSE

Monitor the signals, communication error information and operation setting switches of the Q series C24 module.

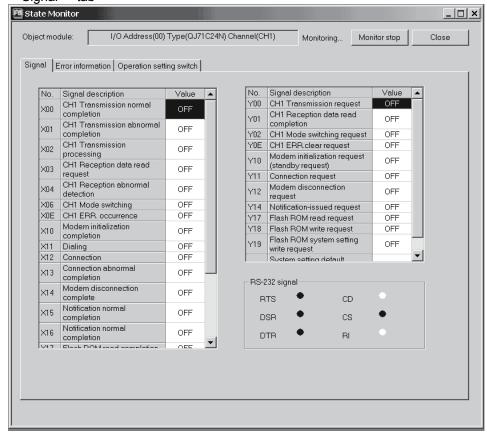

BASIC OPERATION

- 1. Click the [Debugging support function] \rightarrow [State monitor] menu.
- 2. Click the Monitor start button.
- 3. Click the <<Signal>> tab and confirm the signal statuses.
- 4. Click the <<Error information>> tab and confirm the error information.
- 5. Click the <<Operation setting switch>> tab and confirm the operation setting switch setting statuses.

DISPLAY/SETTING SCREEN

<<Signal>> tab

9 - 14 9 - 14

DISPLAY/SETTING DETAILS

<<Signal>> tab

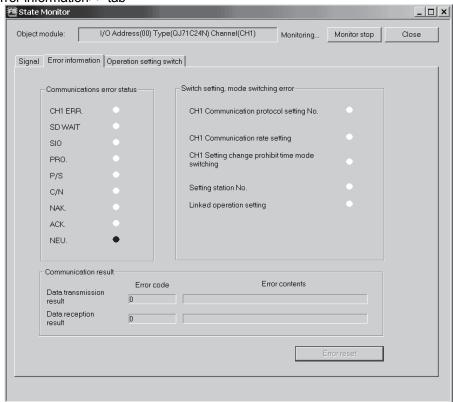

Item	Display/Setting Details	
X signal state monitor	Displays the ON/OFF statuses of the X signals.	
Y signal state monitor	Displays the ON/OFF statuses of the Y signals.	
RS-232 signal monitor	Displays the ON/OFF statuses of the RS-232 control signals.	

For details, refer to the user's manual of the target Q series C24 module.

DISPLAY/SETTING SCREEN

<<Error information>> tab

DISPLAY/SETTING DETAILS

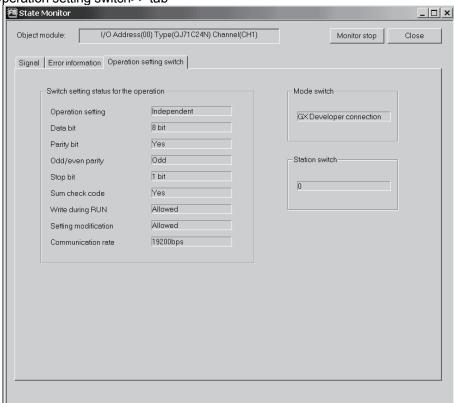

<<Error information>> tab

Item	Display/Setting Details	
Communication error status	Displays the communication error status.	
Switch setting, mode selection error	Displays the switch setting and/or mode selection error status.	
Communication result	Displays the error status of the communication result.	
Error reset button	Resets the error information when XnE on CH1 or XnF on CH2 is ON. Masked in	
	any other cases.	

For details, refer to the user's manual of the target Q series C24 module.

DISPLAY/SETTING SCREEN

<<Operation setting switch>> tab

DISPLAY/SETTING DETAILS

<<Operation setting switch>> tab

Item	Display/ Setting Details	
Operation setting switch	Displays the operation switch setting statuses.	
Mode switch	Displays the communication protocol setting.	
Station switch	Displays the station number setting.	

For details, refer to the user's manual of the target Q series C24 module.

10 PRINT

10.1 Start

PURPOSE

Print the system project, user project or trace data.

BASIC OPERATION

Click the [Project] \rightarrow [Print] menu (extstyle exts

[Setting details of each tab]

<<Main>> Select the item to be printed from among the module

information, project data and trace data.

<<Pre><<Pre>roject data>> Select the details printing option when the project data is

selected as the print item.

<<Trace data>> Select the details printing option when the trace data is

selected as the print item.

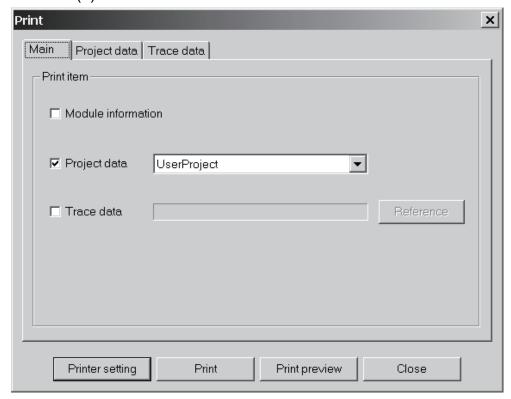

[Setting details of each tab]

Except the header and footer, the printed data are the same as those of each function screen.

DISPLAY/SETTING SCREEN

11 SEQUENCE INFORMATION AND LABEL VARIABLES OF SYSTEM PROJECT

This chapter explains the sequence information compatible with the third party commands supported by the system project and the I/O variables after FB conversion of sequence information.

11.1 System Project Classified by Supported Device Controllers

The system project defines the supported device controller-compatible communication frames (packet construction information, packet data information) and their transmission procedures (sequence information). In the sequence information, the data compatible with the commands of the supported models have been set. Also, the label variables necessary for achieving various commands in FBs have been set. When a communication control program is created on the GX Developer side, the values that match the application and purpose must be set to the label variables.

The next section gives the supported model list, the tables that indicate correspondences between the supported model commands and sequence information, and the label variable lists.

The following denotes how to use the lists in the next section.

	Function name 1:1 correspondence
1) Variable area read	
Command	Sequence Information
Setting area 0 (read only)	Variable area read 1 [Setting area 0 (read only)]
Setting area 0 (accessible)) Variable area read 2 [Setting area 0 (accessible)]
Setting area 1 (accessible)) Variable area read 3 [Setting area 1 (accessible)]

List of the I/O variables used with the function.
All sequence information in the function uses the same I/O variables.

	Variable Area Read Command Input variables Datatype (Data length) ModuleNo.		Variable Area Read Response	
			Output bariables	Datatype (Data length)
//			Module No. OUT_ST_NO	Character string (2)
	IN_ST_NO	IN_ST_NO Character string (2)		Character string (2)
	Read address IN_READ_ADR	Character string (2)	Response code OUT_RES_CODE	Character string (4)
	Number of elements IN_ELEM_NUM	Character string (2) (MAX Value: 6)	Data read OUT_READ_DATA 1 element: 8 bytes	Character string (48) Number of elements×8 bytes

11.2 Supported Device Controller List

The following table lists the supported device controllers.

Maker	Classification	Model name
	Modular temperature controller	In-panel NEO (Model E5ZN)
OMPON		Thermack K (Model E5 ☐ K-AA201 ☐)
OMRON	Digital controller	Thermack K (Model E5 ☐ K-AA202 ☐)
		Thermack K (Model E5 ☐ K-AA203 ☐)
YAMATAKE	Modular controller	DMC10

11.2.1 OMRON make

APPENDICES

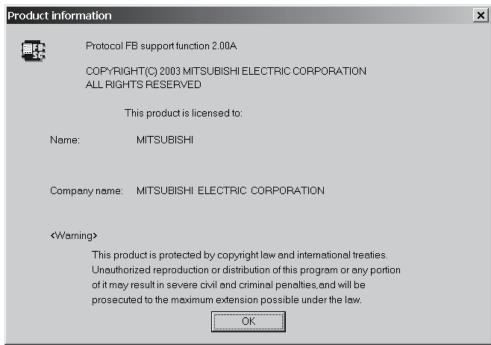

Appendix 1 Help Function

The help function displays the product information.

BASIC OPERATION

Click the [Help] \rightarrow [Product information] menu.

Name	Description
Version	Displays the version of the protocol FB support function.*1
Name	Displays the name set at the time of installation.
Company name	Displays the company name set at the time of installation.

^{*1:} Since the version is the product information of the protocol FB support function, it does not match the version of GX Configurator-SC.

Appendix 2 Project Name Specifications

The following table indicates the restrictions on the set names (such as the project name).

Item	Display/setting		
Project name	Maximum number of characters: 32 characters (If the project name is created within 32 characters, setting is disabled when the total number of characters including those of the project path exceeds 150 characters.) The space after the project name is deleted automatically. A "." (period) cannot be used at the end of the project name. Special characters ¹¹ and words ²² cannot be used.		
Project comment	Maximum number of characters: 32 characters		
Project path	Maximum number of characters: Within 150 characters including those of the project name Path: The project name already existing in the path cannot be specified. The space after the project name is deleted automatically. Special characters *1 and words *2 cannot be used.		
Packet information name	Maximum number of characters: 32 characters The same name cannot be set within the same project. (Case independent.) The spaces before and after the name are deleted automatically.		
Sequence information	Maximum number of characters: 32 characters The same name cannot be set within the same project. (Case independent.) The spaces before and after the information are deleted automatically.		

*1: Special characters The following characters cannot be used.

/:; *? " < > |,

*2: Special words The following words cannot be used.

COM1 to COM9 LPT1 to LPT9 AUX PRN CON NUL CLOCK\$

Appendix 3 Character Strings That Cannot Be Used as Input Variables and Output Variables

When the protocol FB support function is used, the following character strings cannot be used as input and output variables.

The following character strings are used by the protocol FB function in the system. The following character strings are set as labels when FBs are created with the protocol FB function and read to GX Developer.

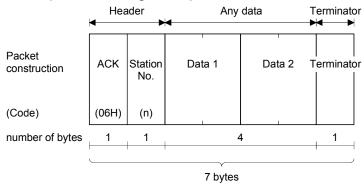

[Unusable character strings]

I_REQ_RECV, I_REQ_SEND, I_START, O_END, O_ERR_CD, O_END_NG, O_R_DATA_NO, V_COMP, V_CTRL_DATA, V_LEN_MAX, V_P1, V_P2, V_R_RESULT, V_RUN, V_S_RESULT, V_WK_B_DATA, V_WK_DATA, V_WK_RECV, V_WK_LEN, V_WK_RECV_B, V_WK_R_O_LEN, V_WK_SEND, V_WK_W_LEN, V_WK_PTR, V_LEN_IDATA, V_PLEN, V_PLEN_END, V_FOR_COUNT, V_DUMMY, V_I_RESULT

Appendix 4 Packet setting example

This section provides the GX Configurator-SC setting screens that correspond to packet examples when sending/receiving data between Q series C24 module and other node.

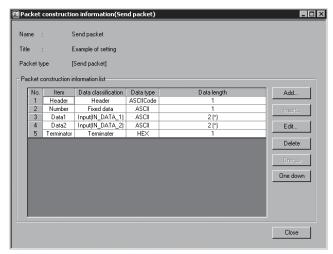

(1) Send packet setting example

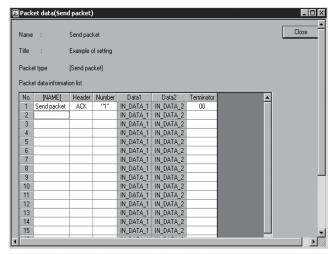

Create new Packet information screen

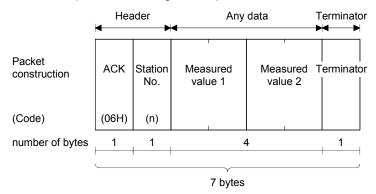

Packet construction information screen

Packet data screen

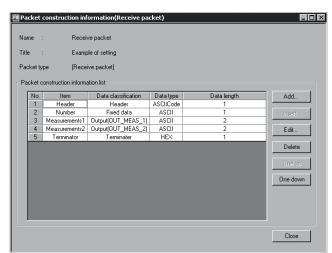

(2) Receive packet setting example

Appendix 5 Newly added functions

(1) Newly added functions

(a) Added functions in Version 2.04E

With upgrade from Version 2.03D (SW2D5C-QSCU) to Version 2.04E (SW2D5C-QSCU), following functions/setting items are newly added to GX Configurator-SC.

Function/Setting item	Details	Reference section
Create receive (specified length) packet	The receive frame with fixed packet length, header and no end judgment data can be created.	Section 7.2
Module start I/O No. setting	With this new function, module start I/O No. can be set at the time of FB program conversion, whereas module start I/O No. was set using GX Developer after FB program is generated.	Section 7.4

With GX Configurator-SC, packet construction information can be set according to the Q series C24 module receive method, as shown below.

Receive method*1	Header (Head frame)	Any data section	Terminator (Final frame)
Method 0	0	0	0
Metriod 0	0	-	0
Moth and 4	0	0	-
Method 1	0	-	-

O: Setting available -: Setting not available

Method 0: Method for receiving data of variable length using either/both of head frame or/and final frame.

Method 1: Method for receiving data of fixed length using head frame.

For details, refer to the Q corresponding communication module user's manual (application).

(b) Added functions in Version 2.14Q

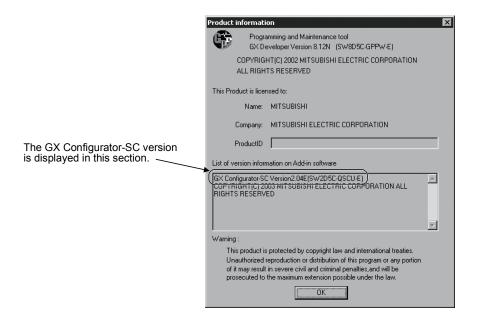

With upgrade from Version 2.13P (SW2D5C-QSCU) to Version 2.14Q (SW2D5C-QSCU), following functions are newly added to GX Configurator-SC.

Function Details		Reference section
Output variable is added to Output variable (O_RUN) for interlock which prevents the send execution before completing the send preparation is added.		Section 8.2.4
Output variable is added to receive FB	Output variable (O_RUN) for interlock which prevents the send execution before completing the receive preparation is added.	Section 8.2.4

App - 7 App - 7

^{*1:} The following outlines the receive method 0, 1.

(2) Checking the GX Configurator-SC software version Check the version within the GX Developer product information. ([Help] → [Product information])
